The percentage of people who need to have antibodies in order to achieve herd immunity against a particular disease varies with each disease. For example, herd immunity against measles requires about 95% of a population to be vaccinated. The remaining 5% will be protected by the fact that measles will not spread among those who are vaccinated. For polio, the threshold is about 80%.

Achieving herd immunity with safe and effective vaccines makes diseases rarer and saves lives.

Find out more about the science behind herd immunity by watching or reading this interview with WHO's Chief Scientist, Dr Soumya Swaminathan.

What is WHO's position on 'herd immunity' as a way of fighting COVID-19?

51 163 453

Emma @Emma1530 · 27 Min.
Isn't the reason we don't vaccinate against chickenpox in the UK is because we want herd immunity?

6 4

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @Emma1530

I think that has an R0 so large that you need pretty much everyone to be immune in order to prevent accelerating outbreaks, the very thing you'd want to stop. More than that, we can prevent all cases, better than HI. In this case that's quite unnecessary. It's injures too few.

Please consider a 😷 in all public communications & wearing one when you're out as a sign you DISAGREE with Govt 'measures' (like masks & stay-at-home orders) whether you're complying or not.
An idea written in to Ivor Cummings.
Ball seemed a good person.

April 13, 2001 - WORCESTER -- Harvey R. Ball, whose creation of two black dots and an upturned curve on a yellow background became one the most universally known symbols of good cheer in the 20th century, died yesterday at the age of 79.

Mr. Ball, a lifelong city resident and decorated World War II veteran, died at the Jewish Health Care Center after a short illness. He is survived by his wife, Winifred, three sons and a daughter. The Smiley Face, designed by Mr. Ball in 1963 to boost employee morale of two merged insurance companies, became as ubiquitous a grin as that of the Mona Lisa. Unlike da Vinci's dame, there was nothing enigmatic about the Smiley Face. Its straight-ahead, feel-good silliness propelled the image to the far corners of the planet.

`` It was truly an international icon,'' said William B. Wallace, director of the Worcester Historical

Yes, pretty awful... The correction doubles the deaths, does it not? And if you state it as a number rather than a % it's a reminder that these stats really count if you want to be 'truthful and insightful'.

Not sure what's happened at WHO but I strongly recommend you don't let any A-level biology students see this lot of chuff. It's factually wrong in numerous ways.

'Herd immunity', also known as 'population immunity', is a concept used for vaccination, in which a population can be protected from a certain virus if a threshold of vaccination is reached.

Herd immunity is achieved by protecting people from a virus, not by exposing them to it.

Vaccines train our immune systems to create proteins that fight disease, known as 'antibodies', just as would happen when we are exposed to a disease but – crucially – vaccines work without making us sick. Vaccinated people are protected from getting the disease in question and passing it on, breaking any chains of transmission. *Visit our webpage on COVID-19 and vaccines for more detail.*

With herd immunity, the vast majority of a population are vaccinated, lowering the overall amount of virus able to spread in the whole population. As a result, not every single person needs to be vaccinated to be protected, which helps ensure vulnerable groups who cannot get vaccinated are kept safe

The percentage of people who need to have antibodies in order to achieve herd immunity against a particular disease varies with each disease. For example, herd immunity against measles requires about 95% of a population to be vaccinated. The remaining 5% will be protected by the fact that measles will not spread among those who are vaccinated. For polio, the threshold is about 80%.

Achieving herd immunity with safe and effective vaccines makes diseases rarer and saves lives.

Find out more about the science behind herd immunity by watching or reading this interview with WHO's Chief Scientist, Dr Soumya Swaminathan.

What is WHO's position on 'herd immunity' as a way of fighting COVID-19?

...them. It's absolutely not a feeling of vindication to see headlines like this. On the contrary, I felt sick reading of these reactions.

researchers believe the allergic reactions could be due to a substance called polyethylene glycol (PEG).

PEG is a chemical compound found in laxative, creams and ointments that is also present in both Pfizer and Moderna vaccines.

It is also found in laxatives as well as creams, ointments, and solvents

NIH launches study on allergic reactions caused by Pfizer's vaccine
I'm very concerned about a small but far from vanishingly small number of severe allergic type reactions, called anaphylaxis ("without protection").
When with Dr Wolfgang Wodarg, I filed..

We did so primarily because we were concerned that the design & length of the clinical trials was not adequate to define the effectiveness of the candidate vaccines to reduce severe illness or transmission.

...them. It's absolutely not a feeling of vindication to see headlines like this. On the contrary, I felt sick reading of these reactions.

researchers believe the allergic reactions could be due to a substance called polyethylene glycol (PEG).

PEG is a chemical compound found in laxative, creams and ointments that is also present in both Pfizer and Moderna vaccines.

It is also found in laxatives as well as creams, ointments, and solvents

PEG has never been used in vaccine on the market, but it is has been in drugs that have triggered anaphylaxis.

X. In the Pfizer/BioNTech mRNA vaccine candidate, polyethylene glycol (PEG) is found in the fatty lipid nanoparticle coating around the mRNA. Seventy percent of people make antibodies to PEG and most do not know it, creating a concerning situation where many could have allergic, potentially deadly, reactions to a PEG-containing vaccine. PEG antibodies may also reduce vaccine effectiveness. Pfizer/BioNTech is also inserting an ingredient derived from

All we ask is reasonable concerns are taken seriously in order to minimise harms.

I. As detailed herein, (a) without the requested stay, the Petitioner and many EU residents/citizens will suffer irreparable harm, (b) the request is not frivolous and is being pursued in good faith, (c) the request demonstrates sound public policy, and (d) the public interest favors granting a stay.

II. Petitioner deems the current study designs for the Phase I/II/III trials of BNT162b2 ("the Pfizer/BioNTech trial") to be inadequate to accurately assess efficacy. Petitioner also deems the designs of clinical trials of vaccine candidates designed to stop dissemination of the virus from the vaccine recipient to others and to prevent or mitigate symptoms of COVID-19 for which PCR results are the primary evidence of efficacy to be inadequate to accurately assess efficacy.

III. Petitioner and the public will suffer irreparable harm if the actions requested herein are not granted, because once the EMA (and other appropriate bodies in the various EU member states) approves the COVID-19 vaccines in question, both governments of EU member states and employers in the EU are most likely going to recommend them for widespread use. If the assignment of cases and non-cases during the course of the trials is not accurate, the vaccines will not have been properly tested. If the vaccines are not properly tested, important public policy decisions regarding its use will be based on misleading evidence. The medical and economic consequences to EU member states and their residents/citizens could hardly be higher

IX. There are some concerning issues with the trial designs, spelled out by Dr. Peter Doshi in the British Medical Journal. Dr. Doshi focuses on the two biggest issues. First, none of the leading vaccine candidate trials is designed to test if the vaccine can reduce severe COVID-19 symptoms, defined as: hospital admissions, ICU or death. And, second, the trials are not designed to test if the vaccine can interrupt transmission (https://www.bmj.com/content/bmj/371/bmj.m4037.full.pdf). If neither of these conditions is met, the vaccine in essence performs like a therapeutic drug, except a vaccine would be taken prophylactically, even by the perfectly healthy, and more than likely carries a higher risk of injury than a therapeutic drug. If this were to be true, then therapeutic drugs would be superior to any COVID vaccine.

X. In the Pfizer/BioNTech mRNA vaccine candidate, polyethylene glycol (PEG) is found in the fatty lipid nanoparticle coating around the mRNA. Seventy percent of people make antibodies to PEG and most do not know it, creating a concerning situation where many could have allergic, potentially deadly, reactions to a PEG-containing vaccine. Great to see. Isn't it peculiar that, within a couple of months of the outbreak in Wuhan, China screened 10 million people & found almost no virus?
Or maybe not, if you've any understanding of how rapidly a virus can reach equilibrium with a population.
What parts do you buy?

More than suspicious. It's downright impossible for there to be, as claimed, a pandemic of a Severe Acute Respiratory Syndrome (SARS) virus 'ripping through the country', yet to have far fewer deaths with the clinical picture you'd expect from a SARS virus: respiratory symptoms.

Dr Mike Yeadon speaks to Julia Hartley-Brewer

Lockdown sceptic Dr Mike Yeadon says the Covid death rate in London is "strong evidence" of herd immunity against coronavirus in the UK.

74 356 923

Grumbleweed @Dalek114 · 9 Std.

@notacunningplan A more recent alternative view on herd immunity. Not given it much thought yet.

1

Steven Baker @notacunningplan · 5 Min.

If London has herd immunity we wouldn't be getting infected at all. Deaths are rising in london, thankfully a slow rate, but they should be reducing if London has herd immunity as infections should come down.

1

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @notacunningplan @Dalek114 und 2 weitere

I'm afraid that's not correct. Herd immunity does not prevent people getting infected. What it does prevent is exponential expansion of an outbreak.
I'd advise you not to rely on "cases" data, as this has, since autumn, completely lost its former good relationship with deaths.

If masks are to stop infected people infecting others, why does he need to wear one? He can't be infected.

2 1

London Titan @LondonTitan · 4. Dez.
Face masks are primarily worn to protect others not the face mask wearer.

My face mask protects you, your face mask protects me.

In this case, his face mask protects them.

And, working there, they're probably tested every single day.

They're not tested there at all.

I used to work there briefly 1982-3. I loved it.

They deal with things that if uncontrolled can be lethal & work on antidotes. I had a tiny part to play in selecting a molecule which became part of the anti-nerve agent pack carried into battle.

The dominant risk factor is AGE.

AGE overrides prior conditions in just a handful of years of age.

It's not correct, for example, to claim someone in their 50s with rheumatoid arthritis is at a greatly increased risk from SARS-CoV-2.

At 70, risks of deaths ~similar to flu.

Antwort an @itsandykenyon @TiceRichard und 5 weitere

That's because it's not true. All the claims recently made in relation to the "new mutant which is more contagious & ripping through..." are false. Not new, no data on contagiousness or actual transmission. In fact, it's lies.
Why are you lying, Mr Hancock?

Didn't need it but close the whole country because hospitals may become overwhelmed? Huh!?

1 43

Farage's Amazon Echo @EchoFarage · 6 Std.
If we hadn't locked down then even the nightingales would've have been overwhelmed Luke. They account for a small percentage of total beds. They were designed as mass mortuaries, when the outlook was uncertain in the first wave.

15

Yardley Yeadon
@MichaelYeadon3
Folgen

Antwort an @EchoFarage @LucasArcady @TiceRichard

I'll say it again. There is no evidence anywhere that 'locking down' reduces hospital admissions or deaths.
You might think it must. I disagree, it doesn't have to. All depends on paths impacted & extent of reduction. Destroy society & get same medical outcomes a few days later.

Frances Beckett @Frannymummy · 30 Min.
Real question is how many people have died as a result of children/teaching staff contracting the virus, taking it home with them & passing it onto other family members. Just because there is 'no data' stating children have died from this, doesn't mean it hasn't affected others.

2

Noting non-covid deaths are lower than normal, I believe a good chunk of that excess is in fact likely misattribution to covid19. In turn, the numbers which may be 'real covid19' (ignoring unreliable PCR mass testing) are lower than routinely die from flu each week at this time.

Dexter Tempest @DexterTempest · 22. jouluk.

Or 1,542 excess deaths as many of your disciples would refuse to recognise. 12.5%. But flu deaths are negligible this year when they would normally be in the hundreds right? And road deaths down. And many other deaths are much reduced by limited human activity.

17 20

Yardley Yeadon
@MichaelYeadon3

Seuraa

Vastauksena käyttäjille @DexterTempest ja @carlheneghan

Road deaths might total 40, so v small adjustment. Which other deaths are down? I think we're seeing far too few deaths to qualify as a public health emergency of any kind. Since 'measures' are not associated with reduced deaths the excuse 'would be worse without' isn't credible.

Dominic Lewin @El_Duderino_788 · 18 Std.

5 year average should not be used as a comparison as it's been a lower than average 5 years. Given the unprecedented policies we should be comparing to previous bad flu seasons to see if anything unprecedented is happening. Anyway here we are vs. The last 30 years.

1 5

Reggie Nurse @reggie_nurse · 12 Std.

So the graphs show that there were 12.5% more deaths that week and that this year is the worst year for deaths for 17 years. Despite massive progress in medical treatments in that time. Not great really

General ward occupancy is "light for time of year".
ICU beds fuller than usual but the reason is doing electives, lost earlier in year.
Even with that, at 94% base capacity.
Measured vs total incl surge capacity, 72%.
It's not true that "hospitals are about to be overwhelmed".

Paul Cresham @pcresh · 5 Std.

There is something interesting going on in London, though. Clearly cases are rising rapidly but are they rising quite as rapidly as they seem? Looking at Havering, for example, explosion in tests but positivity down.

24 29 72

Phil_13 @Phil10and3 · 4 Std.

I put something on another tweet. Mass testing of Teachers and Students was going on in Havering. Also Damian White is the Conservative Council Leader of Havering. Unlucky for us Residents. Read up on him.

"Herd immunity by Tuesday fortnight".
At the tail end of a pandemic, no longer meeting the definition of an epidemic, you can't get the kinds of positivity rates reported. For this reason alone, it's possible to discern the PCR mass testing is fraudulent. Just think why that is.

> **Yardley Yeadon** @MichaelYeadon3
> Antwort an @MichaelYeadon3 @mattsslug und 2 weitere

Yardley Yeadon @MichaelYeadon3 · 16 Std.
Great to see. Isn't it peculiar that, within a couple of months of the outbreak in Wuhan, China screened 10 million people & found almost no virus?
Or maybe not, if you've any understanding of how rapidly a virus can reach equilibrium with a population.
What parts do you buy?

Imagine we had no PCR test & relied on clinical assessments only.
You'd immediately realise that nothing particularly unusual is going on anywhere.
Deaths are a little up, ditto ICU beds, but nothing close to crisis. FGS, look yourself.
Don't let military lockdown happen.

SAGE EXPERT WARNS OF 'HUMAN DISASTER' WITHOUT FULL NEW YEAR LOCKDOWN

Britain faces a 'human disaster' unless ministers impose 'stricter' rules, one of the Government's top scientific advisers has warned.

Professor Robert West, who is part of SAGE, said the Government's current methods were unlikely to contain the spread of COVID-19. He argued the UK needs to bolster social distancing rules and build testing strategies similar to ones seen in Asia.

The odd thing is that, with the odd exception, the NHS is NOT overwhelmed or at any risk of it. Spoke with someone with accurate info from the inside.
Gen wards: lighter than usual. ICU slightly up on normal, due to electives.
With surge capacity, only at 72% of max. No crisis.

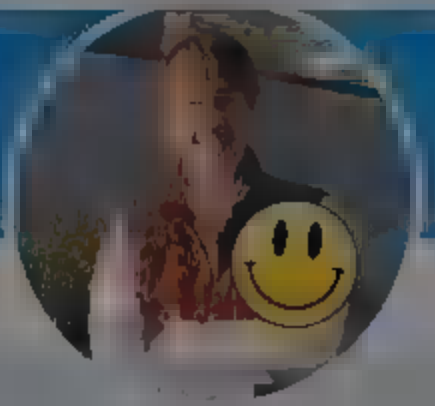
Confused. The result has no status of any kind & may be flat wrong.
Q: why would you bother with this? A negative doesn't clear you for anything, like travel or visiting a vulnerable person, surely?

This is an antigen lateral flow test (antigen LFT) which can give a result in 30 minutes.

The device can be used to identify new cases of COVID-19 in people who do not have symptoms. Anyone receiving a positive test should follow the information in the instructions for use provided with the kit.

A negative test result means that the test has not detected the presence of the COVID-19 virus, at the time the test was taken. Anyone receiving a negative test result should continue to follow the latest guidance for their area.



The MHRA follows a robust assessment procedure when considering applications for exceptional use of a medical device, this includes test kits. Information on the type of evidence that needs to be submitted as part of an application can be found on our website.

A self-test device can be used by a member of the public with no previous experience of testing, in their own

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apri
8, 2020. Estimates of the prevalence of infection following the release of restrictions could
inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2
nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city
residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new
symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000. 95% CI
0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close
contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients
tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of
SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of
lockdown.

Dr Clare Craig @ClareCraigPath · 2 Std.

As I hypothesised here the sudden rise in cases all caused by the same variant could have been due to someone in the labs shedding virus all over the samples.

News of an outbreak in the MK lab rather supports that hypothesis.

This is a theory worthy of serious examination. Note that a professor of molecular virology stated yesterday that not a single part of the claims about the variant was justified by data (& is therefore propaganda). I expect Dr Craig's suggestion will be ignored.

Covid19 is notifiable & 100s claimed dying daily.

Yet almost no notifications.

One obvious explanation is labelling.

Death within 28d post positive test = covid19 death.

But if no respiratory symptoms = not covid19; hence not notified.

Conclsn: PCR test broken.
Anyone?

Yet another set of official data, (notifications), which do not match the narrative.

The ONLY dataset matching the fear narrative is the gobbets of PCR mass testing "cases".

Those testing factories are not audited & lack the test equivalent of an MOT.

Time to pull it over.

Antwort an @NealOKelly @cow_podcast und 2 weitere

Why reaching?

The definition of a covid19 death is unique & grotesque. Never in medical history has an illness, let alone a cause of death, been driven by result of one test, especially one which it's uncontroversial to observe is far from perfect.

My explanation fits.

Does anyone really think locking people up, away from family, carers, routine medical checks & treatments, while in some cases devastating incomes, “save lives”?

No independent analysis anywhere in the world shows crisply & unequivocally that it does.

It’s pure destruction.

It's a good question, and one I've frequently turned over in my mind.

One possibility is I attract no attention at 'Twitter Central'.

Another is they've decided I'm harmless, despite my tweets, because my ability to influence is tiny. That's depressing but likely, I'm afraid.

years. More than 50% of all deaths were people > 80 years or older.

Conclusion

The data support the theory that the current epidemic is a late seasonal effect in the Northern Hemisphere on the back of a mild ILI season. The age structure of those most affected does not fit the evidence from previous pandemics.

The outbreak does, however, fit with the WHO's definition of a Pandemic.

Here's WHO's pandemic summary:

An influenza pandemic occurs when a new influenza virus emerges and spreads around the world, and most people do not have immunity. Viruses that have caused past pandemics typically originated from animal influenza viruses.

Some aspects of influenza pandemics can appear similar to seasonal influenza while other characteristics may be quite different. For example, both seasonal and pandemic influenza can cause infections in all age groups, and most cases will result in self-limited illness in which the person recovers fully without treatment. However, typical seasonal influenza causes most of its deaths among the elderly while other severe cases occur most commonly in people with a variety of medical conditions.

By contrast, this H1N1 pandemic caused most of its severe or fatal disease in younger people, both those with chronic conditions as well as healthy persons, and caused many more cases of viral pneumonia than is normally seen with seasonal influenza.

For both seasonal and pandemic influenza, the total number of people who get severely ill can vary. However, the impact or severity tends to be higher in pandemics in part because of the

I checked deaths profile at EuroMOMO.eu

I don't think is EU-owned, and not all EU states are even involved, but it's a really simple MOrtality MOnitoring system run out of an academic group in Copenhagen. By agreement, each member sends a count of deaths & age band..

...every week. There are some rather interesting profiles there. If the media was giving you accurate information on covid19 deaths, I think you'd probably have a mental picture of what should be happening to all-causes mortality.
Here's the claimed covid19 deaths profile:

United Kingdom: What is the **daily** number of **confirmed deaths**?

Thank you, Simon Jones. Nice to see some informative reporting at last! 😘 Yet again, when a population is surveyed using anything other than our PCR mass testing system, we find low to no virus prevalence. 0.23% positives is identical to the baseline minimum in lateral flow.

Simon Jones @SimonJonesNews
All lorries have been cleared from Manston. 15,526 coronavirus tests have now been carried out, with 36 positive results.

...LFT "misses lots of cases", in my view, that's propaganda. Remember, the PCR test calls 'positive' samples which give a signal even after a large number of amplification cycles, meaning it claims that samples with too little virus to be clinically relevant are 'positive'.

1

Yardley Yeadon @MichaelYeadon3 · 12 s

It's not "LFT missing cases". It's "PCR declaring cases even when there's way too little virus to be clinically infected".
PCR mass testing is like a Speedometer which over-reads, then being used to accuse a correctly calibrated instrument of under-reading

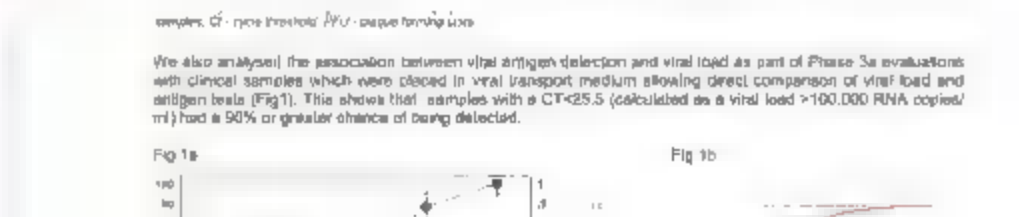
This is an operational false positive rate of 0.32%, which is pretty good for a fast, low-cost test of this kind of design. No smoke & mirrors here. The technology used is extremely similar to that in a home pregnancy test.



We also analysed the association between viral antigen detection and viral load as part of Phase 3a evaluations with clinical samples which were placed in viral transport medium allowing direct comparison of viral load and antigen tests (Fig1). This shows that samples with a CT<25.5 (calculated as a viral load >100,000 RNA copies/ml) had a 90% or greater chance of being detected.

...LFT "misses lots of cases", in my view, that's propaganda. Remember, the PCR test calls 'positive' samples which give a signal even after a large number of amplification cycles, meaning it claims that samples with too little virus to be clinically relevant are 'positive'.

2 25 148

Yardley Yeadon @MichaelYeadon3 · 35m

It's not "LFT missing cases". It's "PCR declaring cases even when there's way too little virus to be clinically infected".
PCR mass testing is like a Speedometer which over-reads, then being used to accuse a correctly calibrated instrument of under-reading

Antwort an @KevMalone3 @PaulEmbery

It's a misunderstanding to believe that the risk associated with age & that from certain chronic illnesses are equivalent.
They are not.
AGE is the dominant risk factor. It is not true, for example, that a 50yo with two chronic illnesses is even close to the risk for a 60yo.

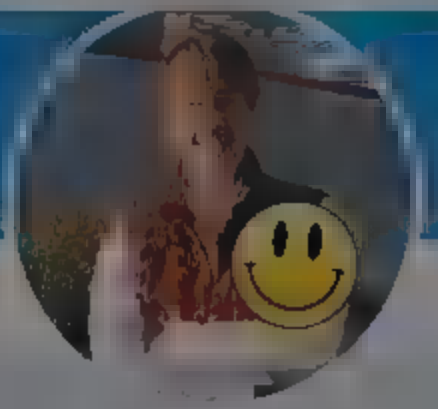
Als antwoord op @emsayle



While that's true, pls remember that 50% of those dying 'with' the virus are over 83years old. There's no direct evidence that it's the virus which kills them. That's why we say 'with'. If it was responsible for deaths, mean age at death surely would be lower than mean longevity?

Why would they do that?
There's a risk that they'll be antibody negative & that would show their testing is not trustworthy.
Can't see them taking the risk.
Also, they might be antibody positive from earlier infection. A false positive can occur even in an immune subject.

> **Dr Clare Craig** @ClareCraigPath
> This was three weeks ago now. I presume you are going to confirm these supposed PCR positives with antibody testing? It's only 6 tests - no big deal to do it.

Please see 18-43min. Recorded Dec 19 2020.

What I have to say is not, in my view, scientifically contentious. Obviously it runs directly against the media and Govt/SAGE narrative. Pls make up your own minds. Why would I say this if I didn't believe it?

Anywhere that PCR mass testing is challenged, it falls on its face. It's disgraceful. Whether it's retested students in Cambridge, general pop in Liverpool & Merthyr Tydfil or 15,000 lorry drivers at Manston: any other test shows very little virus anywhere. You're being lied to.

Your friend hasn't the stats, he's a no doubt busy ambulance driver.
That gives him insight only into his patch, which is not national bed occupancy stats.
Or do you think his job qualifies him to know NHSE bed occupancy stats? If you do think that, why do you think that?

Ok, I'll tell my friend that. They've been ambulance crew for 15 years, working right through the pandemic. Probably one of the least dramatic and most rational people I know. But hey, you've got some stats.

4 6

Al W @avw751 · 5 Std.

My sister in law waited 24 hours for an ambulance which never arrived. Ended up getting a friend to take her to hospital! Broken hip. 6 hour waits are not unusual! This btw is a disgrace but I question if what we are seeing this year is unusual.

2 1 7

V McCarthy @VMcCarthy15 · 5 Std.

That's awful for your sister-in-law, must have been agony. There are often stories of such waiting times. My sense is that we have the usual seasonal difficulty but alongside a stream of Covid patients, who each take far longer to deal with because of their infectious status.

Antwort an @VMcCarthy15 @avw751 und 3 weitere

Yes, that much is definitely true. No one says otherwise. I certainly have not.
But that component is in large measure self-inflicted.
Using PCR mass testing to determine infection status of admissions isn't smart. A huge error which they're just beginning to rectify (using LFT).

Joel Smalley @RealJoelSmalley · 30 Min.

Given that most COVID deaths occur in hospital, by implication there must also be a strong correlation between testing and death but this cannot be empirically tested due to different admission-to-death intervals.

2 3 19

Joel Smalley @RealJoelSmalley · 30 Min.

If COVID is not causing excess death, what is? Is pillar 2 testing driven by genuine prevalence of the virus or is testing driving the case rate and affecting the hospital stats as a result? If I were in charge of public health, I'd really need/want to know.

This is definitely worth looking at. If you're teetering & not sure what to believe then, before reading this thread, consider what relationship you'd expect between excess deaths & covid19 deaths, broadly.

Joel Smalley @RealJoelSmalley
Since 2nd Nov, there is no statisitcally meaningful correlation between deaths within 28 days of a positive COVID test and all-cause excess death. There is no signal at normal scale, log scale or diff-log, suggesting the two are independent of each other.

Frontiers | Covid-19 Mortality:

160 countries & 850,000 covid19 deaths were studied in excruciating detail. Age & obesity associated with more deaths.

But nothing Govts did (principally lockdown & other restrictions) made any difference to deaths.

Deviation from the vertical axis indicates extent to which the labelled factor was associated with a change in covid19 death rates.
As can be seen, lockdowns & other restrictions were not linked to reduced death rates.
This paper doesn't study negative impacts of measures, but...

useless.
No responsible Govt can continue to do what they're doing. We, the people, must use the emerging evidence that LOCKDOWN SAVES NO ONE BUT KILLS MANY as well as destroying the economy.

1

Yardley Yeadon
@MichaelYeadon3

Folgen

On top of that, the national testing system yields nothing but results WHICH CONFLICT WITH EVERY OTHER DATA SERIES. We must tell the executive that what's being done is misleading & if they persist, we can only conclude it's deliberate & malign (for whatever motives).

01:38 - 28. Dez. 2020

1

Yardley Yeadon @MichaelYeadon3 · 29 Sek.
Do note as well, that not only has 'lockdown' been shown not to help, but that asymptomatic transmission is also a lie. Mask wearing, as we were initially told & consistent with the best research prior to the pandemic, neither protect the wearer nor others around them.
Nothing...

"Conclusions inferences on effects of NPIs are non-robust and highly sensitive to model specification. Claimed benefits of lockdown appear grossly exaggerated".

As in "lockdowns do not save lives" exaggerated. That type.

Study design and setting We explored two models developed by Imperial College that considered only NPIs without accounting for mobility (model 1) or only mobility (model 2), and a model accounting for the combination of mobility and NPIs (model 3). Imperial College applied models 1 and 2 to 11 European countries and to the USA, respectively. We applied these models to 14 European countries (original 11 plus another 3), over two different time horizons.

Results While model 1 found that lockdown was the most effective measure in the original 11 countries, model 2 showed that lockdown had little or no benefit as it was typically introduced at a point when the time-varying reproductive number was already very low. Model 3 found that the simple banning of public events was beneficial,

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COVID-19 control measures were imposed in Wuhan between January 23 and April 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

This is great. The first time the notion of "asymptomatic transmission" was mentioned, I smelled a rat. It's biologically implausible. Not saying it's never happened once, but as an important contribution to transmission? No. To be a source, you need lots of virus in your...

Post-lockdown SARS-CoV-2 nucleic acid scre
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2,3✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COVID-19 control measures were imposed in Wuhan between January 23 and April 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

minimizing harms to society, was met with such venom. Now we see the WHO, too, succumbing to political pressure. This is the only rational explanation for changing the definition of herd immunity that has existed for the past century.

The science has not changed; only the politics have. And that is precisely why it is so dangerous and deadly to subject virus management to the forces of politics. Eventually the science too bends to the duplicitous character of the political industry.

When the existing textbooks that students

What does ‘confirmed covid19’ mean here? In adults its Newspeak for a single positive PCR test often without symptoms. This page gives impression there are many ill children. Are there? Ill in what way?
I’m a huge supporter of this campaign for kids; dubious about the science.

Yet more publicly available data ties in with historical immunology & not the nonsense you get daily.
There's just one dataset not lining up with all others: it's the results of PCR mass testing. It's utterly & brazenly fraudulent. Operators won't respond to criticism.

Joel Smalley @RealJoelSmalley
It is clear that the COVID epidemic began 23rd Feb and was over by mid-May. Peaking after 5 weeks and lasting around 12 weeks puts it right in the expected range for a virus outbreak. In other words, interventions didn't change nature.

And if you correct for aging demographic and soft prior seasons, it would effectively disappear.

That's what a no-lockdown, following WHO 2019 Pandemic Guidelines epidemic looks like

Michael Levitt @MLevitt_NP2013
Why strange? For 9,000 reported deaths to be 9,000 excess deaths, every Swede dying with COVID19 would have had no other chance of dying in 2020.

12 200 407

AllAboutIbiza2020 @UKRave · 9 Std.

The scientific basis underlying the plans to test all schoolchildren is fatally flawed. SAGE can read the literature too. It's not in any doubt that asymptomatic transmission is an irrelevance. Without this, there's no basis for ANY mass testing. Just say no, give no consent.

Do we know how many routine operations and related ICU impact are not happening because of COVID? Is that why we have additional capacity?

Data Nerd @harrsica · 9 Std.
Antwort an @MichaelYeadon3 @olithinks @allisonpearson
There are some real issues with some hospitals. Ventilators are now only used as a last resort which is why numbers there are down. Some are genuinely running out of oxygen and staff are being redeployed to other hospitals with all electives cancelled...

No. It won't be enough to count only excess deaths & I would have thought it obvious why that would be. Access to the NHS has been restricted for 9mo & this has already led to a clear pattern of excess deaths nationally that is uncharacteristic of respiratory virus epidemics.

In particular, I predicted that the epidemic would not reignite in London. Obviously, we have many "cases" but I urge people to disregard these & instead to look at excess deaths, on the principle that a severe (occasionally lethal) respiratory virus would show itself this way.

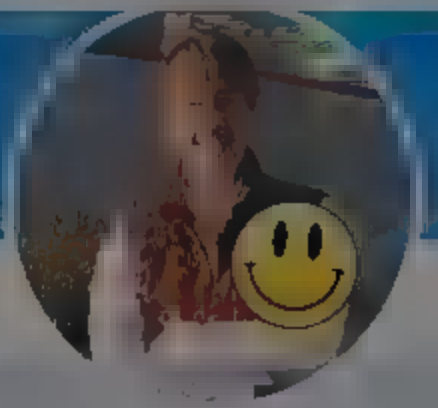
So if excess deaths in London reach >20% of the April peak, will you finally admit that you were wrong?

2 3



Yardley Yeadon @MichaelYeadon3 · 5 Std.
No. It won't be enough to count only excess deaths & I would have thought it obvious why that would be. Access to the NHS has been restricted for 9mo & this has already led to a clear pattern of excess deaths nationally that is uncharacteristic of respiratory virus epidemics.

This is important. Under international law, it is illegal to force people to accept experimental medical procedures. New vaccines might be fantastic, but this cannot be guaranteed. If you're not high risk from SARS-COV-2 infection, don't accept it or be pressured. Just say no.

23 December 2020 11:05 CET+01:00

The French government has postponed a controversial draft law proposal that opposition politicians said amounted to forcing people to get the Covid-19 vaccine in order to access certain services.

Dear doctor, you too can read the literature & so you know that asymptomatic transmission is not a thing. Therefore masks are superfluous (in any case, the greatest weight of evidence is they don't work) as is mass testing of the well. It's not helping if you reinforce untruths.

Some of your fellow scientists think that, whilst *true* asymptomatic transmission rates are low, 'many have really mild disease'. (And let's not forget the pre-symptomatic cohort either). So it appears the literature says different things.

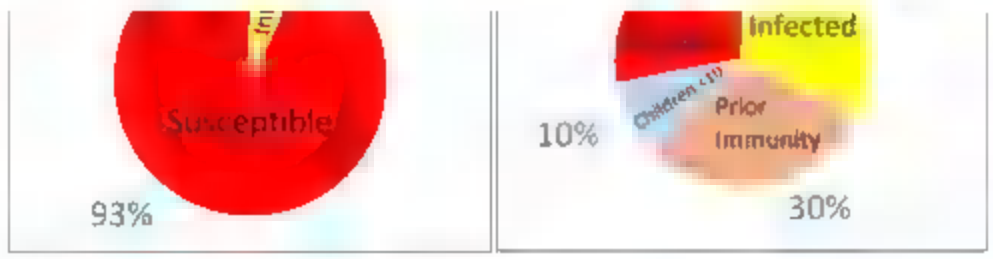
That said, I thought the immunology so clear that I made three, specific & testable predictions which should apply if I was right. Please examine them, on the right, under the pie chart:



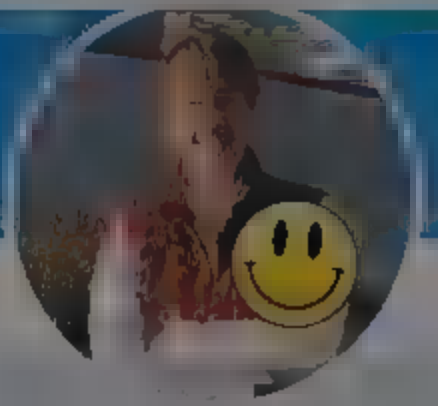


Chart 1:	Chart 2:
-no prior immunity -just 7% infected -93% susceptible remain ***FULL BLOWN PANDEMIC CONTINUES*** **Testable predictions:** • Very large number of additional deaths • Will resume in the capital • Will proceed at similar speed to spring Will continue **indefinitely**	-30% prior immunity -as many as 32% infected -28% susceptible remain ***PANDEMIC IS ESSENTIALLY OVER*** **Testable predictions:** • Smaller, regional outbreaks with far fewer deaths • Does not re-ignite in the capital • Grows much more slowly than in spring. Endemic equilibrium is **imminent**

Dr Yeadon has adjusted the size of the susceptible population in Chart 2 so it is between <30% and <40%

Herd immunity is not reached until around 70% of the population have had the disease. Considering that Covid has a death rate of around 1% this would ensure around 660,000 needless deaths.

Folgen

Antwort an @chris_cjd @JamesMelville

The hospitals are nowhere near capacity. Some are, but they almost always are, during what we've called for years the "NHS winter crisis".
In fact the objective data shows lower loadings than most winters. They're not running out of oxygen either. It's deliberate deceit.

That really does look manufactured. I've been looking at graphs & figures of biological data for almost 40y since starting my training & the last values especially look "improbable". Epidemics across regions don't coordinate like that.

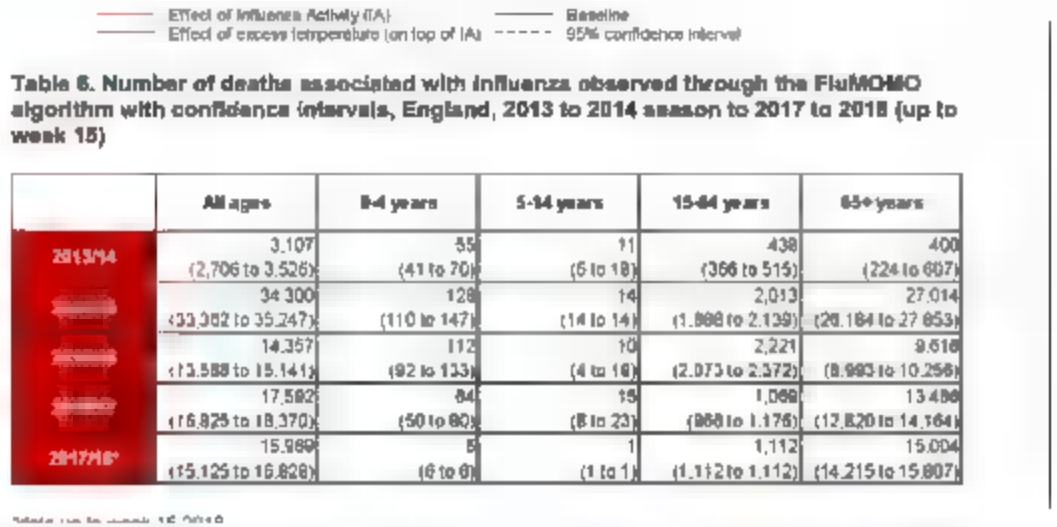
England alone 34,000 deaths attributed to influenza 2024-15. Translates to around 40k-44k U.K. as a whole. And no 'funny business' about 'with' vs 'from'.



Effect of influenza Activity (IA)
Effect of excess temperature (on top of IA)
Baseline
95% confidence interval

Table 6. Number of deaths associated with influenza observed through the FluMOMO algorithm with confidence intervals, England, 2013 to 2014 season to 2017 to 2018 (up to week 15)

	All ages	0-4 years	5-14 years	15-64 years	65+ years
2013/14	3,107 (2,706 to 3,526)	55 (41 to 70)	11 (5 to 18)	438 (366 to 515)	400 (224 to 607)
	34 300 (33,382 to 35,247)	128 (110 to 147)	14 (14 to 14)	2,013 (1,888 to 2,139)	27,014 (26,184 to 27,853)
	14,357 (13,588 to 15,141)	112 (92 to 133)	10 (4 to 16)	2,221 (2,073 to 2,372)	9,616 (8,993 to 10,256)
	17,582 (16,825 to 18,370)	84 (50 to 80)	15 (8 to 23)	1,068 (968 to 1,176)	13,486 (12,820 to 14,164)
2017/18*	15,989 (15,125 to 16,828)	5 (6 to 6)	1 (1 to 1)	1,112 (1,112 to 1,112)	15,004 (14,215 to 15,807)

Really clear. Markers of respiratory symptoms NOT much up recently, but because of millions of recent, untrustworthy PCR mass testing, we end up with a huge no of “covid19 patients” & then “covid19 deaths” misattribution.
It’s pretty much that simple. Its over bar the shouting.

Dr Clare Craig @ClareCraigPath
On the left is what an epidemic looks like.

On the right is what misdiagnosing patients who would be in hospital anyway looks like.

This is great. The first time the notion of “asymptomatic transmission” was mentioned, I smelled a rat. It’s biologically implausible. Not saying it’s never happened once, but as an important contribution to transmission? No. To be a source, you need lots of virus in your...

ARTICLE

https://doi.org/10.1038/s41467-020-19802-w OPEN

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and April 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

Yet, in contradiction to the 'dry tinder hypothesis (that 1-2 hard winters deaths reduced the size of the highly vulnerable pool for covid19 to kill, this spring) they did not see strong winter deaths signals on the last two years.
So I can't explain their covid19 profile.

Fairbrit @wealdengirl · 30. Dez. 2020

Can u explain the flurry of NHS doctors appearing on TV, the press, online, all claiming ICUs & wards are so full of Covid patients that ambulances cannot unload incoming patients. Their claims aren't congruent with data but I am assuming that doctors don't lie? Can U clarify?

5 2

brod justice @brodjustice · 30. Dez. 2020

Full hospitals are congruent with the data. Look at the ONS excess deaths data, it's running consistently over 14% for weeks now. @RealJoelSmalley often presents misleading data, here he seems to have used deaths "by occurrence" - ONS specifically warns will be misleading.

I don't recall anyone numerate claiming that the FPR was 100%, but it was certainly true that the only relevant measure, which integrates FPR & prevalence, is the FALSE DIAGNOSIS RATE & that was 100% on one occasion & a very sizeable 39% the next time.

1 1

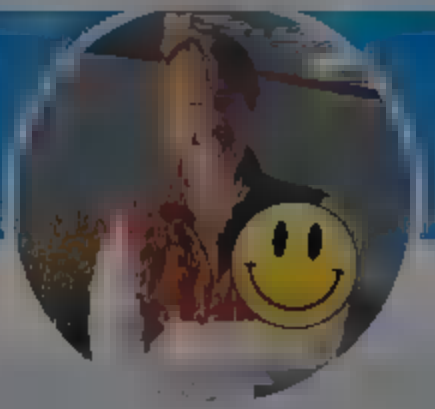
Jan Abbott @JanAbbo76901039 · 32 Min.
Hi, I may be being a bit dense here. These are actual deaths from Covid, so 85. Then what are the figures given to us every day by the bbc? They also claim they are Covid deaths. They obviously don't tally!

1

Yardley Yeadon
@MichaelYeadon3

Folgen



Antwort an @JanAbbo76901039 @daveyruss und 2 weitere

They don't tally as rule is death from any cause w/in 28d of a positive test = covid19 death.
The NOIDS assignment will be symptom & clinical assessment based. Any person prior to 2020 would use the latter to diagnose an illness & never the former.
"Cases" from PCR = meaningless.

classify COVID-19 as an HCID. This was based on consideration of the UK HCID criteria about the virus and the disease with information available during the early stages of the outbreak. Now that more is known about COVID-19, the public health bodies in the UK have reviewed the most up to date information about COVID-19 against the UK HCID criteria. They have determined that several features have now changed; in particular, more information is available about mortality rates (low overall), and there is now greater clinical awareness and a specific and sensitive laboratory test, the availability of which continues to increase.

The Advisory Committee on Dangerous Pathogens (ACDP) is also of the opinion that

Yardley Yeadon
@MichaelYeadon3

Romy Cerratti @RomyCerratti · 2 Std.
Keep up the restrictions and Covid myopia and we are looking at a million + deaths from undiagnosed illness, mental illness and economic deprivation. I suggest you read the work of Prof Phillip Thomas (Bristol Uni) on projected lockdown death toll v Covid. Also worldwide poverty.

1

David Meikle @archied009 · 2 Std.
I'd rather follow the advice from the scientists and vast majority of the medical profession, but thanks anway

1

Romy Cerratti @RomyCerratti · 2 Std.
It's not about advice. It's about a cost/benefit analysis. And by the way 'the science' is extremely divided on the risk of Covid, but fairly united on the devastation of lockdowns and restrictions.

1 1

David Meikle @archied009 · 2 Std.
75,000 deaths, 50,000 infections per day currently and your talking about 'cost/benefit analysis'. I guess you want want the vaccine then ?

There have been many really detailed analyses of lockdown / restrictions in >160 countries & the only certainty is they are NOT correlated to reduced deaths.

Prof Sikora isn't an epidemiologist; those on SAGE mathematicians. Karol is a broadly experienced biologist as am I. Immunological principles led to this profile in London. The data is from ONS. Notice no excess deaths recently & reflect on it's meaning: herd immunity.

Antwort an @JeremyClarkson

ONS all-causes deaths data for London, up to date. What's happening in London that you regard as requiring 'new measures' & what do you actually mean? The London profile implies herd immunity. Unless you've a better explanation? Stick to cars & writing. You're good at that.

Yardley Yeadon @MichaelYeadon3 · 16 Std.

That's a helluva long & wriggling answer time a simple question, isn't it? I can do better & I have reservations:
"Short term safety is acceptable. Long term, nobody knows because it's not yet been examined. We'll find out after a few hundred million people have been vaccinated"

WΔRTimeGirl @WarTimeGirl
News reporter asks Bill Gates if vaccine is really safe. This was his answer..

374 1,2 Tsd. 2,3 Tsd.

John Bradbury @JohnBradbury12A · 6 Std.
Can you give any examples of long term safety issues that have been experienced with previous vaccines?

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @JohnBradbury12A

I expect you think this question is relevant to long term safety after administration of a new kind of biological intervention. It isn't. Remove the label vaccine for a moment. Now think again about the potential for unwanted effects over greater spans of time. No one knows, yet.

I invite people to run the thought experiment: "what if the 'cases' data is inaccurate?" Ignore 'cases', look instead only at excess deaths (per M Levitt's tweet). Does that look characteristic of an epidemic? It's completely diff from spring or any winter flu outbreak. London:

Now check the 3 predictions I made months ago. They've all happened. Compare predictions from SAGE's statements: they're all wrong.

Even neutrals at this point might ask themselves "if he's been right on all predictions, maybe he's correct now?"

isn't it true, anyway? Again, I regret to inform the reader that yes, its absolutely central. And no, its not true.

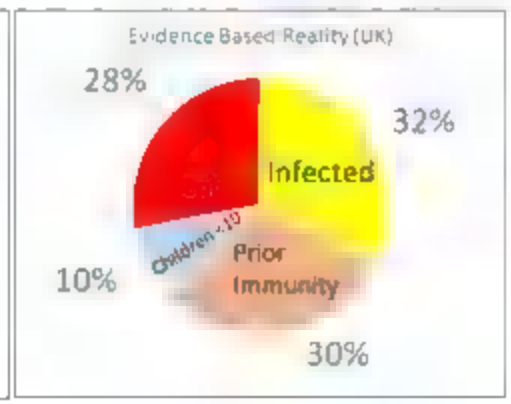

Chart 1:	Chart 2:
-no prior immunity -just 7% infected -93% susceptible remain ***FULL BLOWN PANDEMIC CONTINUES***	-30% prior immunity -as many as 32% infected -28% susceptible remain ***PANDEMIC IS ESSENTIALLY OVER***

Liittynyt lokakuu 2018

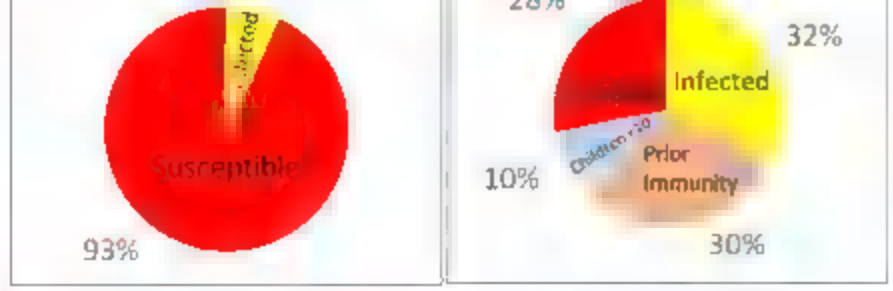

Chart 1:

-no prior immunity
-just 7% infected
-93% susceptible remain

FULL BLOWN PANDEMIC CONTINUES

Testable predictions:

- Very large number of additional deaths
- Will resume in the capital
- Will proceed at similar speed to spring

Chart 2:
-30% prior immunity
-as many as 32% infected
-28% susceptible remain

PANDEMIC IS ESSENTIALLY OVER

Testable predictions:

- Smaller, regional outbreaks with far fewer deaths
- Does not re-ignite in the capital
- Grows much more slowly than in spring.

Endemic equilibrium is imminent

It is risible that official deaths attribution recently invites us to believe that all-causes mortality (other than 'with covid19') is substantially LOWER than usual, despite restricted access to NHS for 9mo plus much stress. Alternatively, there is huge misattribution on cause.

A thoughtful read which I believe is well worth the few minutes it'll take.
Obviously, I'm biased (as are we all) so when an articulate medic recommends the same course of action as I do, I'm bound to approve. If you disapprove, pls specify why.
Thanks

> On its return is has been, generally, far less deadly. Much you would expect. The most vulnerable died on first exposure, and far fewer people had any resistance to it, at all. Now, a number of people do have some immunity, and may of the vulnerable are already dead.
>
> Which means that, in this so-called second wave COVID19 is of no greater an issue than a moderately bad flu season.
>
> If I were to recommend actions. I would recommend that we stop testing – unless someone is admitted to hospital and is seriously ill. Mass testing is simply causing mass panic and achieves absolutely nothing. At great cost. We should also just get on with our lives as before. We should just vaccinate those at greatest risk of dying, the elderly and vulnerable, and put this rather embarrassing episode of mad banner waving behind us.

Which means that, in this so-called second wave COVID19 is of no greater an issue than a moderately bad flu season.

If I were to recommend actions, I would recommend that we stop testing - unless someone is admitted to hospital and is seriously ill. Mass testing is simply causing mass panic and achieves absolutely nothing. At great cost. We should also just get on with our lives as before. We should just vaccinate those at greatest risk of dying, the elderly and vulnerable, and put this rather embarrassing episode of mad banner waving behind us.

50 223 592

The Empty Womb @EmptyMamma · 28 Min.
1) is the author trying to say that the spike in March-May was Covid—19, but was not statistically significant? Z score on that looks huge to me.
2) I agree that winter 2020 spike is statistically insignificant...is he saying the pandemic was over by summer?

2 2

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @EmptyMamma

On 1), he is saying it swept through & took many people away. On 2), yes, he is saying the public health emergency was complete by late spring. Mass testing yields huge nos of 'cases' but recent xs deaths are not epidemic in nature, but local, self-limiting outbreaks. It's over.

I'm completely convinced the virus is real, killed many in spring (tho many also died from 'measures'), which is why briefly we did have a huge public health emergency.

It's our continuing extreme responses, which I loosely term 'immunity denial', that I don't understand.

I don't doubt the data for a moment. But it seems you've decided the cause of filling ICUs is covid19 even though numerous datasets run contrary to that proposition. If you examine the acute respiratory illness (syndromic) indicators, none match up with covid19 admissions.

That paper got ripped apart by people who didn't - as these authors did - start w assumption lockdown worked, so all they had to do was to assign portions of that to each intervention. It's not even science, really, and highly misleading. Lockdown is not assoc. with saving lives.

Schools are not involved in SARS-COV-2 transmission. While that may seem surprising, you need to be symptomatic with the virus (ill with it, actually have overt covid19) in order to transmit it effectively. Kids generally aren't symptomatic with it. We've known this since spring.

Yes, there is strong evidence for child to adult transmission. These findings are from the TFC: Children and transmission paper published by SAGE on Gov.uk on 31st December.

- This is based on data up to the 2nd December 2020
- This analysis shows that children and young people are more likely to bring the virus into the household than those aged 17+. They are also less likely to catch the virus within the household. This is consistent with previous analysis of household transmission (14 October).
- **External exposure** shows how likely someone is to be the first case in their household. Young people (aged 2-16) are much more likely than those aged 17+ to be the first case in their household. In particular, those aged 12 to 16 are nearly 7 times as likely to be the first case in their household, compared to those 17+.
- **Transmissibility** shows how likely someone is to pass the virus on within the household, if they are the first positive case. The analysis shows that 2 – 16 year olds are more than twice as likely to pass on the virus within their household compared to people aged 17+.
- **Susceptibility** shows how likely someone is to catch the virus, if someone else in their household has brought it in. Children aged 16 or under are less likely to get the virus from someone within their household compared to people aged 17+.

With respect, statements by SAGE carry no greater weight in & of themselves than unsupported statements by anyone else including me.
Independent research looked for but failed to find increased risks from schools being open in spring.

Asymptomatic transmission is so low as to not be reliably measurable. Whether by children or adults. This isn't a surprise. Well, perhaps only to those who'd never thought about this until 2020. Children are much less likely to become symptomatic with covid19.

Looks like someone copied and pasted the formula wrong on the 'cases' spreadsheet! 27% of all London tests are positive? That's a lot of 'sick' people and something to worry about if true. I'm open minded but scientifically that looks odd, and I do a lot of root cause analysis.

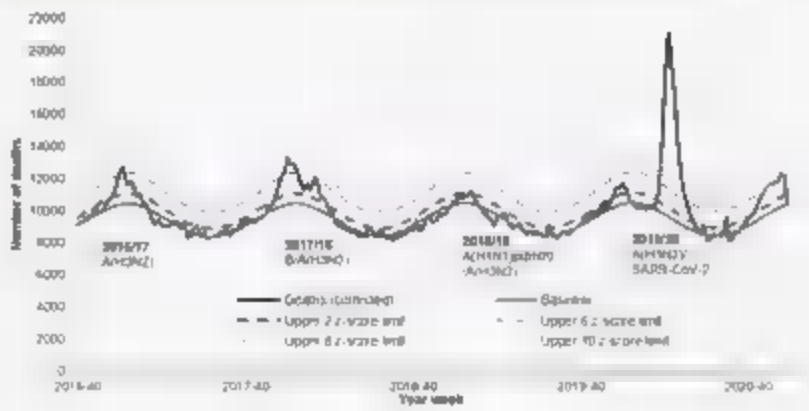
It's depressing that SAGE sits in its sealed box & adheres to mathematical models which use unreliable cases as input, use an incorrect value for IFR & ignore prior + emerging immunity. No wonder their projections are fearful! But they're wrong. Latest ONS.
twitter.com/pcrclaims/stat …



(source: Office for National Statistics). This is a similar to the 12,292 estimated death registrations in week 50 2020.

Excess all-cause (EuroMOMO) mortality in subpopulations, UK

In week 52 2020 in England, no statistically significant excess mortality by week of death above the 2 z-score threshold was seen overall, by age group and sub-nationally (all ages) after correcting GRO disaggregate data for reporting delay with the standardised EuroMOMO algorithm (Figure 3). This data is provisional due to the time delay in registration; numbers may vary from week to week

In the devolved administrations, no statistically significant excess all-cause mortality for all ages was observed for Northern Ireland in week 51. Statistically significant excess mortality was observed for Scotland in week 46. Data was not available for Wales.

Figure 1: Weekly observed and expected number of all-cause deaths in all ages, with the dominant circulating respiratory virus, England, 2016 to week 52 2020

Note: The recent weeks' data are estimates with large registration delay corrections and therefore should be interpreted with caution. These estimates may differ substantially to future reports as the actual number of deaths become known

If you think any of us will stop pointing out for example that the absence of excess deaths in London recently means herd immunity is in force, you've another think coming. Replies with data & logical argument welcomed. Ad Homs = wasted electrons.

Replying to @stevexe42 @RCPath @jneill

It's not simple but clear a proportion of the recent excess deaths which are attributed to covid19 don't make sense. If you've not seen Joel Smalleys Fact Book on public syndromic monitoring, its sobering. All respiratory signals are way down, despite a SARS virus. Inexplicable.

The shape of the elevation of excess deaths in recent time are DEFINITELY not respiratory virus epidemic in nature.
To test my proposition, examine the EuroMOMO all-causes mortality trace for 5 years. Nowhere is there such a slow rise. I think most of these are 'lockdown deaths'.

Part of the reason I am not convinced by the narrative - that the virus is ripping through a largely non-immune population, killing 1 in X hundred people, biased strongly to the oldest - is London.
This lack of recent excess deaths shows this is completely wrong.

I'm interested in explanations of the London profile in autumn/winter. It just doesn't fit the narrative.
What does fit is a heavily infected population saw self-limiting Covid19 deaths, the limiter being running out of non-immune & vulnerable people.
Maybe other explanations?

Antwort an @Wikiland @RealJoelSmalley

Self-isolation of a significant slice of an already tired staff isn't helping. They aren't ill with Covid19 but every positive test sees loss of a valuable staff member.
In short, there's a staffing crisis, not a patient overload crisis.
Back to my main question though, please.

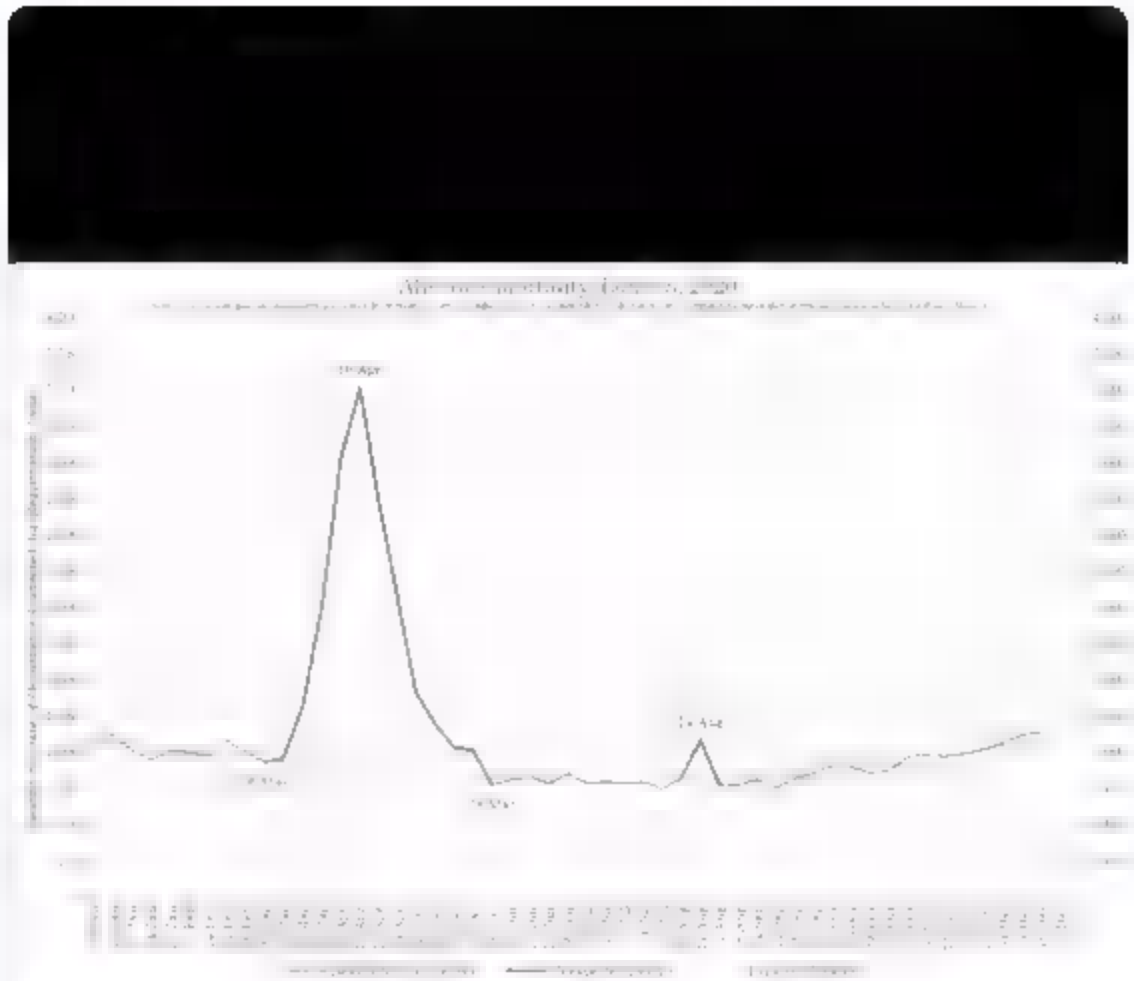
Well, the steep rise in mortality STOPPED for a while two weeks after the November lockdown began (after week 46). Four weeks later, deaths went up again ... Where gov't goes wrong is in failing to get infection rates down (cf. Taiwan, NZ).



2

Yardley Yeadon
@MichaelYeadon3

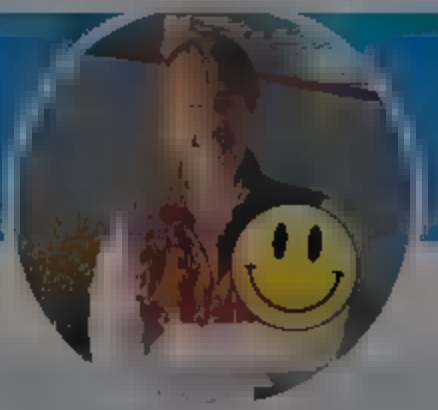
This slide shows that the huge numbers of "covid19 deaths" you're sombrely told about each evening recently are mostly misattributed other deaths. Not caused the the virus at all. It was mostly all over by late spring.
It's been mostly bad PCR mass testing since & it's opaque.



Jonathan Engler @jengleruk
Fortunately, this tool also has an option for displaying deaths by date of occurrence. It looks like this:

If London “cases” preceded “covid19 deaths” in autumn / winter like they did in spring, one of them is WRONG.
I don’t think any bodies aren’t being counted?
Do that leaves “cases” wildly disconnected from endpoints, and if it’s happening in London, it’s wrong elsewhere too.

Jonathan Engler @jengleruk
And deaths by occurrence date:

Yet again, watching London's nightly news, you're told of many "covid19 deaths". But they're not, are they? They misattributed deaths from other causes. Not from the virus. It's not responsible for many deaths recently in London. Not even an epidemic any more. Don't trust "cases"

I don't recall that at all. Do remember though that no one knew what would happen last spring, so if you're referring to that, that would be unreasonable. Now? We know for sure that kids, parents, teachers are NOT at elevated if schools open. U.K. & International data shows this.

Surely now we know that kids, teachers, parents and their families are NOT at elevated risk when schools are open, studies in U.K. & internationally show this, its purely damaging to close schools. Who's benefitting from closure? It's crushing kids & families for sure. I despair.

Tim. Very interesting. Can you point out where in the computations (1) extent of prior immunity & (2) immunity arising from surviving infections is included?
I've good evidence that these two factors are responsible for terminating the outbreak entirely in London, for example.

I say this due absence of EXCESS deaths in London this autumn / winter, for which I'm struggling for an explanation which doesn't involve those factors. I'm well aware that there are thousands of deaths attributed to the virus but the lack of excess deaths makes that problematic.

It's only this last year that anyone with basic knowledge of immunology would doubt that this would be the result of respiratory viral infection.
This is also why so many (30-50%) had prior / cross-over immunity from exposure to related, common cold causing coronavirus, eg OC43.

> **Ivor Cummins** @FatEmperor
> This is HUGE - and adds to all the science already done.
>
> Covid infection confers immunity for at LEAST 6 months, and highly likely much, much longer

Peter Faber @PeterFaberSP · 47 Min.

It's logical. As long as there are no mutations that get around the immunity, you'll be immune for the rest of your life. (provided you stay reasonably healthy)

This was already known. It's why you don't need measles vaccines every year. It doesn't mutate much.

Sorry, that's completely wrong. It's so misleading that, if you were selling something, the ASA would be calling you out. The clinical trials do not touch on either hospitalisation or death. The entirety of the 'efficacy' is a reduction in becoming PCR positive. That's it.

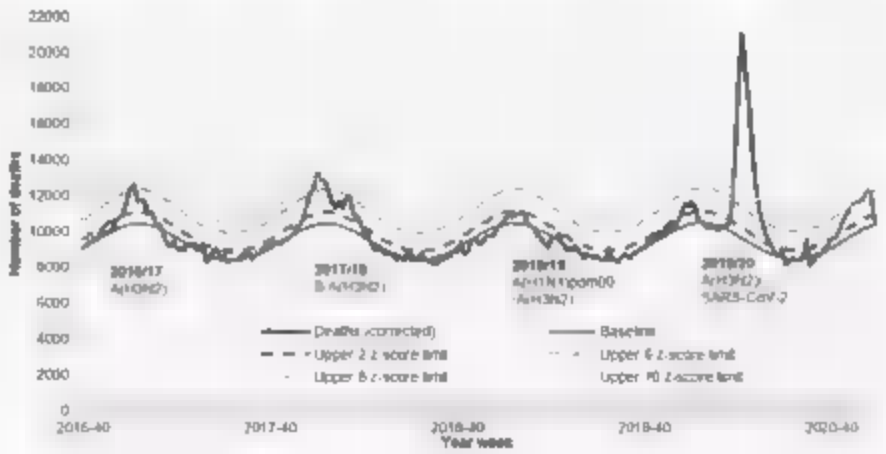
Latest data, paradoxically, shows no excess deaths at all. So much for a respiratory virus tearing through the community. Lots of deaths attributed to it, but no excess deaths. Doesn't that worry anyone, or just me? It isn't plausible. The narrative is wrong. "Cases" unreliable.

All-cause death registrations (ONS), England and Wales



In week 51 2020, an estimated 13,011 all-cause deaths were registered in England and Wales (source: Office for National Statistics). This is a similar to the 12,292 estimated death registrations in week 50 2020.

Excess all-cause (EuroMOMO) mortality in subpopulations, UK

In week 52 2020 in England, no statistically significant excess mortality by week of death above the 2 z-score threshold was seen overall, by age group and sub-nationally (all ages) after correcting GRO deaggregate data for reporting delay with the standardised EuroMOMO algorithm (Figure 3). This data is provisional due to the time delay in registration; numbers may vary from week to week.

In the devolved administrations, no statistically significant excess all-cause mortality for all ages was observed for Northern Ireland in week 51. Statistically significant excess mortality was observed for Scotland in week 48. Data was not available for Wales.

Figure 1: Weekly observed and expected number of all-cause deaths in all ages, with the dominant circulating respiratory virus, England, 2016 to week 52 2020

> The AZ/Oxford vaccine gives (at best) immunity at rates of approx 60% after the first shot, and the course of immunisation is not regarded until the second jab is given - whether that be 3 weeks or 12 weeks later. NO Vaccine in the history of the earth has given 100% immunity.

Are you blaming the public again ? People have locked down & freed up repeatedly since Nov, as per rules, at great personal costs. Displacing blame for government failure on a suffering public simply fuels a feebly communitarian argument to restrict liberty without proven benefit

We now know that if one isn't symptomatic, they're not infectious.
The notion of 'asymptomatic transmission' is manufactured, depended on just 6 'case reports' & 7 individuals: completely dismantled by @ClareCraigPath & @jengleruk

This context makes freq testing superfluous.

Germany - most astonishing contrasts: huge numbers of declared covid19 deaths yet absolutely normal all-causes mortality.
Can anyone offer an explanation?
Here's one: the EuroMOMO algo covers only part of the country.
That's grasping at straws. I'm seeing huge misattribution.

Simon Nicholls @sinichol · 13 Std.

Sorry you attribute all this to FPs and none to differences in public health advice/procedures, t&t effectiveness, or levels of community cooperation/compliance?

e.g. I've seen no equivalent of the lunatic @ClareCraigPath or @toadmeister misinformation on German social media.

1 1

No freedom no life @Blox26519267 · 12 Std.

Stop Press: Several readers have got in touch to point out that the reason for the alarming case data Boris cited in his announcement – 80,000 on December 29th alone – is because the UK is testing more people than any other European country. One reader has calculated that we're currently testing between six and 14 times more people every day that France, Italy and Germany. Another drew our attention to the number of "cases" in the UK for January 4th as recorded on Worldometers, which dwarfed that of France, Italy and Germany, even though the number of deaths is quite similar:

UK – 58,784 Cases/407 deaths

France – 4,022 Case/378 deaths

Italy – 10,800 Cases/348 deaths

Germany – 8,039 Cases/527 deaths

"Strange," says the reader. "Over 10 times more cases than France with a similar number of deaths. Germany had over 100 more deaths, but 50,000 fewer cases."

I assume this is a joke? The effectiveness of lockdown is not altered by the capacity or lack of it in hospitals.
I'm against this & prior lockdowns (with the exception of first, experimental 3wk stretch in Mar 2020) because they're proven not to save lives, only destroy them.

change, something might have gone awry.

> As an example: your view on the merits of the current winter lockdown versus the Halloween lockdown. First: do you think a lockdown is *prima facie* defensible? To some people, 'no!'; to far more people, 'normally no, but it depends'. Whatever initial view you put into your decision hopper, now try to bend that assumption around the first input of information: the healthcare system either (a) clearly has capacity left, apparently running at below average levels for the time of year, as it was in October; or (b) might credibly need to triage fairly basic healthcare within, say, three weeks as seems to be the case now, or so we are

Thank you, Ivor & Joel. It's hard to make it clearer.
One possible way to make the illustration starker might be to focus briefly on excess deaths in London. That picture begs numerous mechanistic questions, and I think the most plausible answers are instructive.

Firstly is there actually any evidence of a "new variant " ? And if so isn't that the same as any other year with respiratory viruses, they change slightly in order to survive no ?

Influenza mutates to a 'new set of duds' most years, so to a large extent, our immune systems act as if it's new.
Coronaviruses are relatively stable. A year's gone by and it's still 99.9% the same.
That's why it'll soon be irrelevant (if the Stasi allow normal sci to operate).

You assume these are EXTRA deaths. Now, they might be. But please be aware that none of these are clinical diagnoses, like if I'd died of lung cancer. That's a pretty solid diagnosis. These are labels attached to anyone & everyone who dies for any reason within 28d of +ve test.

Of course the above is just illustrating what 1k/day means. In reality we know over the last month infections have risen dramatically.

Over this month deaths will rise too.

BUT then they will begin to fall. Lockdown will buy us time for the vaccine cavalry. We mustn't waste it.

If you're saying deaths will fall because lockdown will first reduce infections, I have to disappoint you. It's a neat narrative, but it's WRONG.
Lockdown as practised has too small an impact on infection to reduce deaths.
Studied in 180 countries: no effect.

You'll see near the north-south axis at the top that lockdown stringency is not associated with reduced mortality.
Many factors are very important, but LD is not among them, despite the utterly indiscriminate damage they wreak.

Missing the point.

It's "the system" - including the way fear has been inappropriately weaponised - that has led to this which I am railing against, not the individual officers.

That people think it's OK as it's "the law" and "for the greater good" is even more troubling. twitter.com/mrandmrstran/s…

Gradually, step by step, many are allowing themselves to be winched to viewpoints they'd have been appalled to have held in 2019. The most horrifying is "the end justifies the means". The line used by authoritarian regimes through the ages.
It doesn't, by the way.

There was notable excess deaths attributed to covid19. I think these are mostly genuine covid19 deaths. Of course, they've now ceased, herd immunity having been attained, as it was very early on in London. It should be understood that, if the virus really was circulating again...

...in "cases" in London & associated with this, a large rise in deaths attributed to covid19.
I am simply looking at all-causes mortality in London. Thousands of people can see this, too. My interpretation is clearly that it's misattribution; wholly attributable to bad testing.

I recall the story in the autumn that "antibodies are falling, fear that immunity is, too". Nonsense. Misunderstanding about what these data tell us. The body does not maintain high levels of serum antibodies against infective agents, of such agents continue to circulate.

Jonathan Engler @jengleruk
There are some interesting, but not conclusive, observations to be drawn from looking at the proportion of people who have SARS-CoV-2 antibodies in different regions.

So I immediately saw what these "falling antibodies" stories meant: that SARS-COV-2 itself isn't circulating, at least in the places where serum antibodies were falling in the population. Consistent with this notion, which is basic immunology, is the autumn elevated in the NW.

Very interesting study. May I ask, what is your measure of infection?
Is it number of people with a positive test for presence of SARS-COV-2 by PCR, divided by the population?
Or perhaps the % of pop with antibodies?
(Apologies if it's in a link, for I didn't look there).

Lockdown stringency was NOT associated with reduced mortality in a study of over 180 countries.
Numerous other factors clearly are associated with changes in mortality, so it's not lack of sensitivity. Just that these restrictions aren't effective.

One thousand deaths today. Were this to continue at that level without intervention that's 31,000 deaths a month, and getting on for 100,000 deaths a quarter.

800 84 293

Yardley Yeadon @MichaelYeadon3 · 7. Jan.

Do you know how many deaths we normally have each day?
Roughly 1600-1700.
Now, if SARS-CoV-2 is killing 1000 people each day, that's 2600-2700, right?
Problem is, that's not true.

133 1,3 Tsd. 3,9 Tsd.

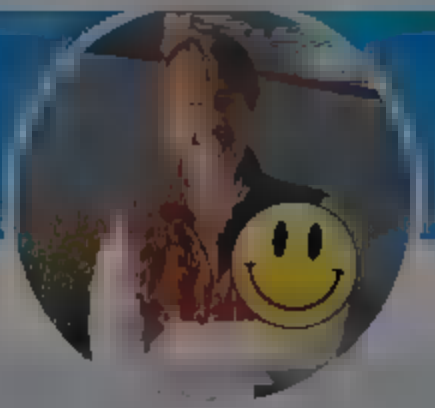
MJ @oppatunist · 16 Std.

I was wondering what the all cause mortality *excluding* covid looked like compared to historical data. ie, has the lockdown reduced deaths from other causes, (car crashes, work related etc) and by how many. I have a feeling it will be negligible, but I have been challenged on it

1

Yardley Yeadon
@MichaelYeadon3

Folgen



Antwort an @oppatunist @simondolan @tomhfh

All-causes minus covid19 is hugely LOWER than usual. Only RTA deaths (2k pa) are arguably lower, and those are fortunately tiny vs totals (over 600k pa). So reduced non-covid19 deaths not faintly explained. Expectations are for more deaths, surely, after 9mo reduced NHS access.

France has reopened its schools, citing low risk of children becoming ill, less likely to be symptomatic & "if free of symptoms, less likely to be contagious". Can we have their ministers, please? Places are much more cheerful hearing children playing!

returning children to the classroom.

So is France different, and - if yes - why is that?

1. What we know about children and Covid-19

"Children can be infected and infect others, so reopening schools means increasing the risk of infection," Pascal Crépey, an epidemiologist at the Ecole des Hautes Etudes en Santé Publique, told The Local.

"What we know is that children are much less likely to be symptomatic. And when you are less symptomatic, you are less likely to be contagious."

While research seems somewhat divided on this point, it is the opinion of France's state health council, Haut Conseil de la Santé, that children are neither prone to become seriously ill from Covid-19, nor are they likely to infect adults.

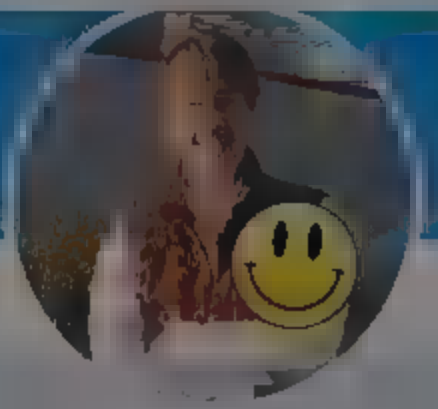
The Council's stance is based on scientific findings that that young children have lower viral loads. This does not mean they are not contagious when they carry Covid-19, but it means they unlikely to develop severe forms of the virus.

Scientists in the UK recently published a report that backed this up. It said up to 70 percent of children infected with Covid-19 could be asymptomatic, which means they could have the virus without showing any symptoms.

Professor Martin Hibberd of the London School of Hygiene and Tropical Medicine told the Guardian that the proportion of asymptomatic Covid-19 cases was "probably more like 50 percent for those in secondary school while for boys and girls in primary school, around 70 percent may not be displaying symptoms even though they have picked up the virus".

Hibberd agreed that this could mean that children were also less likely to pass the virus on to others.

"It's a real possibility but we cannot yet be sure," he said.



2. What we learnt from the second wave of Covid-19

Among the evidence that backs this up are the differences in the first and second waves of Covid-19

@MichaelYeadon3

Follow

Replying to @AlistairHaimes @toadmeister

Alistair, the BBC just put a piece about about hospitals not being especially loaded (on average, they're not) but used the staffing shortage factor as accelerant. Add serious doubts based on public data that they're wrong about the variant & MPs have been done over again.

Craig Wheway @NHSWarrior40k · 7. Jan.

Professors have modelled school and infection rates and weighed it against the negatives of kids at home and productivity for families. No point telling the public because they can't even keep 2m apart.

Antwort an @NHSWarrior40k @Fox_Claire

Mathematicians have modelled and, so far, wrongly. They didn't need to model. There's plenty of good quality empirical evidence. There's one of our problems right there. No interest in what works & has this been tried / outcome etc. Nope. Model it. Oh dear. Computer says no.

Another possible inference is that the extent of 2020 deaths wasn't to do with whether or not a country locked down early or not, or for a prolonged period or stringent way (which doesn't seem to fit anyway) but to do with these intrinsic factors. I found it thought provoking.

with COVID-19 patients that oxygen is running low and beds have been added to the intensive care unit, divided by plastic sheeting.

The pushback comes amid the most lethal phase in the outbreak yet, with the death toll at more than 350,000, and it could hinder the government's effort to vaccinate somewhere between 70% and 85% of the U.S. population to achieve "herd immunity."

Administrators and public health officials have expressed hope that more health workers will opt to be vaccinated as they see their colleagues take the shots without problems.

1 2 3

Best not to use mathematical models which utterly discount prior / recent immunity (which will be more complex & complete protection). Why? Because we'll likely over-administer what is a new kind of treatment. You just never do that. Not ever have we done this & for good reason.

That's a shame. We have indeed had a 2nd spike of PCR positives, but a #SecondaryRipple of covid19 fatalities.
No question SARS-CoV-2 has killed many, however those who believe in a 2nd spike of similar size to the 1st are immunity deniers.
And distressingly credulous about PCR.

Postcard From Luxembourg: normality is restored prior to vaccination.
I've repeatedly said that "test, test, test" is madness, if the tests are unregulated. Why? 'Because pandemic', NO PCR mass testing has a declared operational false positive rate.

...thing we're trying to measure. And it's rather chicken & egg, if we use the sample measuring instrument to do that! Imagine the prevalence was also 2%. Now with an oFPR of 2%, the number of 'cases' is right only half the time. Even this doesn't sound too bad, does it?

1

Yardley Yeadon @MichaelYeadon3 · 51 Sek.
There's still a raging pandemic on, right? Well, hold on. What if the oFPR is a little higher? What if the real prevalence is a little lower? It really doesn't take very much, once the oFPR is bigger than the prevalence for the false diagnosis rate to skyrocket.
Bluntly, I...

Yardley Yeadon @MichaelYeadon3 · 9 Min.
What if the false diagnosis rate was 90%?
Don't misunderstand me. I'm a thorough believer in the existence of this virus.

2

Yardley Yeadon @MichaelYeadon3 · 4 Min.
To exemplify: the NHS is under severe winter pressure. Many staff are unavailable, largely due to forced isolation from testing. Also, I'm told the adaptations to the conditions make normal work almost impossible. Trying to keep apart patients in different categories must be...

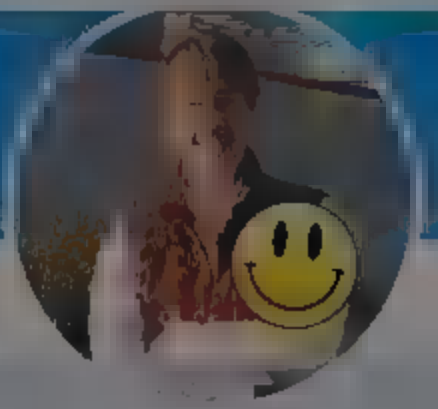
This is great. The first time the notion of "asymptomatic transmission" was mentioned, I smelled a rat. It's biologically implausible. Not saying it's never happened once, but as an important contribution to transmission? No. To be a source, you need lots of virus in your...

ARTICLE

https://doi.org/10.1038/s41467-020-19802-w OPEN

Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch



Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and April 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

Bluntly, this is why we never announce trial results, solely by press release, unaccompanied by a detailed report for industry analysts at the same time.
Once you look at the details, you'll be left scratching your head about what you thought you knew.

transmission is uncommon outdoors.
Separately, there's RCT quality evidence that mask wearing doesn't protect anyone.
Now we're told it might be actively unhelpful to wear masks.

Outrageous. Speaker should check the quality of the evidence for protective effect (wearer or others) of masks? Its woeful.
The largest RCTs show no benefit to anyone from mask wearing.
Watching people use them, me included, you can see hugely increased face touching. Not good.

> **Hugh Osmond** @hughosmond
> Tens of thousands have deaths have been caused by covid infections caught in hospitals through poor infection control. Not a single death has been shown to be caused by someone not wearing a mask. Who has blood on their hands? There is sanctimonious smugness and there are facts. twitter.com/bbc5live/statu…

It'd be instructive to hear your interpretation of PHE data showing an alarming disconnect between 'cases' from PCR testing & lack of excess deaths over normal for mid-winter. The virus is real alright, but you must deal with serious misattribution of cause of death.

5/42 1. They do not capture anything like the current total level of NHS demand which is very differently shaped due to COVID-19. Traditional, existing, NHS datasets were built to reflect "normal" levels of demand, "normal" operations and "normal" capacity. This isn't normal.

Antwort an @ChrisCEOHopson

I've dozens of NHS contacts & what you describe exactly matches their feedback to me. No denial here.
What troubles me greatly is complete lack of proper validation of PCR testing. No diagnostic test is meaningful without it. Yet it's the SOLE source of cases & COVID death stats.

Antwort an @MichaelYeadon3 @ChrisCEOHopson

It is not the sole source of Covid death stats. The ONS death-certificate death stats are based off a diagnosis of death by a medial professional/coroner if appropriate. Yes, test status will inform this, but the human professional has final say on cause of death.

Caution on cycles: this means only that they will run to that number. What that doesn't tell us is approximately what cycle & range captures the bulk of the tests declared positive.
If, say, 90% of positives are under Ct30, I'd feel different vs 90% over Ct30. We're never told.

It's the total lack of transparency about the majority of PCR mass testing, the most important medical diagnostic test ever run in U.K., that disturbs me the most.
Why don't we see Ct info by decile every week? PHE does this level of data assembly weekly for all-cause mortality.

Antwort an @jillcoleman77 @BareReality

A persons "vaccination status" is irrelevant. The vast majority are NOT at elevated risk of severe outcomes incl deaths if they catch this virus. They should not be vaccinated. Those at risk will soon all have had the opportunity to be vaccinated, almost everywhere. Job done.

This is great. The first time the notion of "asymptomatic transmission" was mentioned, I smelled a rat. It's biologically implausible. Not saying it's never happened once, but as an important contribution to transmission? No. To be a source, you need lots of virus in your...

ARTICLE

https://doi.org/10.1038/s41467-020-19802-w OPEN

Post-lockdown SARS-CoV-2 nucleic acid scre
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]

Stringent COVID-19 control measures were imposed in Wuhan between January 23 and April 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270–0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423–0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

Davie G @DavieG08721921 · 6 Std.
It states at the top of graph people who have tested positive after a nose and mouth swab. I thought cases were meant to be with symptoms/diagnosis to count?

4 4

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @DavieG08721921 @ClareCraigPath

Believe it or not, a “confirmed case” is a person testing positive. That’s it. No symptoms required. False positives all count, not only to “cases” but to “covid19 deaths” as well.
Given policy seems entirely driven off “cases”, “covid19 deaths” & all points between, it matters.

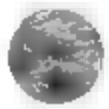
Strong words but the sentiment has solid foundations. The best designed & largest / longest RCTs show masks unhelpful in blocking transmission/infection. And looking at them & how they're used, is anyone surprised?

DocDM @DocDM4
Antwort an @trishgreenhalgh



We do not need to wait for any RCT at all, the vast majority of masks are useless in protecting the individual against #COVID19 - your zealous push for more masks, for a virus with a mortality rate of 0.23% (WHO), is simply more unhippocratic fearmongering and medicalised sadism.

The Chinese Communist Party's Global Lockdown Fraud | by The CCP's Global Lockdown Fraud | Jan, 2021 | Medium

The order of events makes it clear where the original notion of 'lockdown' derives. It's not turned out well in any case.

It's always distressing when the NHS is under extreme winter pressure. There's no doubt parts of it are, but this is by no means uniform. What mystifies me is belief that lockdowns make a blind bit of difference. There's no solid evidence that I don't find seriously questionable.

One third of NHS capacity is given over to a single disease.

And we can see the effects on total cases through the year. I'm baffled that you don't see it

1 5

Cathy Kelly @CathyKe02679654 · 2 Std.
No, one third is given to people that have tested positive and are in hospital with all causes. Total reliance on and justification for such extreme measures are based purely on a test, which has not proven to be reliable, is that solid ground to argue from & decide policy on?

No, it didn't. The title is self explanatory & is incontrovertible proof that:
1) lockdown did not in any way turn the tide in spring &
2) the outbreaks were self-limiting.
That's why I'm quite sure what we're being told is happening isn't.
We all need to rumble it together.

... citizen freedom in direct conflict with heavily funded testing labs who clearly have financial interests in higher test positivity"

This is one of the reasons we need full disclosure from those running the private, Lighthouse Labs.

symptom development but only observe 7–10 days of infectiousness (n=176) when benchmarking the Ct values against cell culture. Increasing the sample size of a study like Liotti *et al.* is likely to find cases that extend the long tail of qPCR positivity post-recovery and post-infectiousness. Liotti *et al.* implies the vast majority of qPCR positive samples will be non-infectious patients. They describe a mean of 48.6 days of qPCR positive. They also describe 7-10 days of infectiousness. This produces a range of non-infectious qPCR positive to infectious qPCR positive ratio of 4.86:1 to 11:1. This is an alarming rate of quarantine for non-infectious patients. To quarantine a patient, you must have evidence of existing infectiousness, not RNA from a past infection. The Corman-Drosten manuscript ignores this medical ethics question whilst also compromising the accelerated peer-review process by a gross failure to disclose financial conflicts of interest.

To quarantine a patient, you must have evidence of existing infectiousness, not RNA from a past infection. The Corman-Drosten manuscript ignores this medical ethics question whilst also compromising the accelerated peer-review process by a gross failure to disclose financial conflicts of interest.

The authors' premature escalation of their work to the WHO prior to peer review is alarming. The lab testing revenue and therefore conflicts of interest of various authors were not properly disclosed in the initial Eurosurveillance peer review. Had the journal been aware of the conflicts they may have placed more scrutiny on the review.

Likewise, we have not seen the authors exhibit the same urgency in updating the WHO regarding the reported false positives from the hastily reviewed Corman-Drosten paper. This raises important questions regarding the lab testing conflicts of interest of various authors.

Addendum: Corman-Drosten Review Report by an International Consortium of Scientists in Life Sciences (ICSLS). Peer-reviewed literature and preprints covering wet-lab experiments, in silico analysis of the Corman-Drosten protocol-design, meta-data analysis on Eurosurveillance org and further discuss on

This interview reveals a revolting character underlying a pseudoscientific justification for imprisoning people. Quarantine is for sick people. Lockdowns are for prisoners. And they anyway don't do what it says on the tin. Instead they cause suffering. Sadists back them.

DocDM @DocDM4
There is no moral justification for lockdown. It is an imported policy from a communist one-party state. If it were an operation, no surgeon would offer it as risks outweigh benefits wildly. We should never have accepted it. Great article by @toadmeister - …

Quite a surprise. Ferguson isn't qualified to comment on such things. He lacks understanding of basic biological concepts, partly explaining why his predictions are often so extreme.

1.2K shares

399 comments

- **Ferguson's grim predictions of 500,000 deaths in the UK convinced government to implement first lockdown**
- **Now he says London may have herd immunity because 25-30 per cent of the population has been infected**
- **He adds that areas in the Northwest of England could be on its way to herd immunity too**

'Professor Lockdown' Neil Ferguson has revealed that London could already have herd immunity against the coronavirus which will help life 'get back to normal' by autumn.

Ferguson, whose grim predictions of 500,000 deaths in the UK convinced the government to implement the

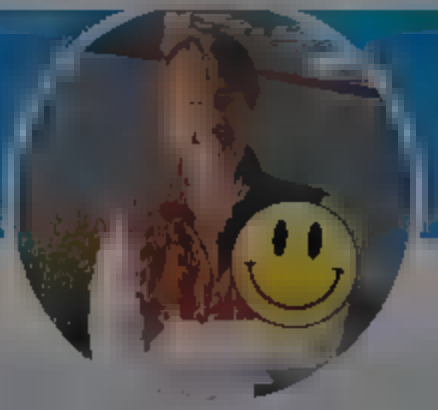
Post-lockdown SARS-CoV-2 nucleic acid scr
in nearly ten million residents of Wuhan, Ch

Shiyi Cao[1,11], Yong Gan[1,11], Chao Wang[1,11], Max Bachmann[2], Shanbo Wei[3], Jie Gong[4], Yuchai Hua
Tiantian Wang[1], Liqing Li[5], Kai Lu[6], Heng Jiang[7,8], Yanhong Gong[1], Hongbin Xu[1], Xin Shen[1], Qing
Chuanzhu Lv[10✉], Fujian Song[2✉], Xiaoxv Yin[1✉] & Zuxun Lu[1✉]



Stringent COV-D-19 control measures were imposed in Wuhan between January 23 and Apnl 8, 2020. Estimates of the prevalence of infection following the release of restrictions could inform post-lockdown pandemic management. Here, we describe a city-wide SARS-CoV-2 nucleic acid screening programme between May 14 and June 1, 2020 in Wuhan. All city residents aged six years or older were eligible and 9,899,828 (92.9%) participated. No new symptomatic cases and 300 asymptomatic cases (detection rate 0.303/10,000, 95% CI 0.270-0.339/10,000) were identified. There were no positive tests amongst 1,174 close contacts of asymptomatic cases. 107 of 34,424 previously recovered COVID-19 patients tested positive again (re-positive rate 0.31%, 95% CI 0.423-0.574%). The prevalence of SARS-CoV-2 infection in Wuhan was therefore very low five to eight weeks after the end of lockdown.

Richard @RichC25087320 · 8. Jan.
Hospitals are running at full capacity we have shortages of beds & trained staff the situation is clearly dire. Did you consult with hospital Consultants, Doctors & Nurses prior to taking this rebellious position!

Antwort an @RichC25087320 @DJWarburton

If you believe lockdown would help, I would I understand your position. I am not aware of evidence supporting that proposition however & very much showing that it doesn't.
In other words, the intervention isn't one expected to work. Why vote for something harmful yet won't work?

I salute a rational decision maker, in an era where following the herd, even if this injures others, is seen as “the right thing to do”.
I no longer recognise my country.

I support Toby Young's viewpoint that, even if we disagree with a persons position, we must fight to the death for their right to express it, or we are lost. Sumption said how we interact through a crisis is more important than performance in any particular crisis (paraphrasing).

Yes, this. I'm not a subject matter expert yet made exactly this point in my articles referencing #SecondaryRipple phenomenon. Once HI is attained (if it is, of course) in winter transmission, we're a great deal safer as winter eventually fades to spring.

> **M Gabriela M Gomes** @mgmgomes1
> Antwort an @youyanggu

This seems a reasonable trade off & it has to be calculated. Every week in these abnormal circs close to 1000 excess non covid19 deaths are occurring, mostly at home. When did this last happen? Seriously - since the NHS was set up?
88% and go - please. Or some target to fix on.

> **Sacha Lord** @Sacha_Lord
> Gov't just confirmed that 88% of COVID fatalities come from the top 4 levels.
>
> They expect to have vaccinated them by mid Feb.

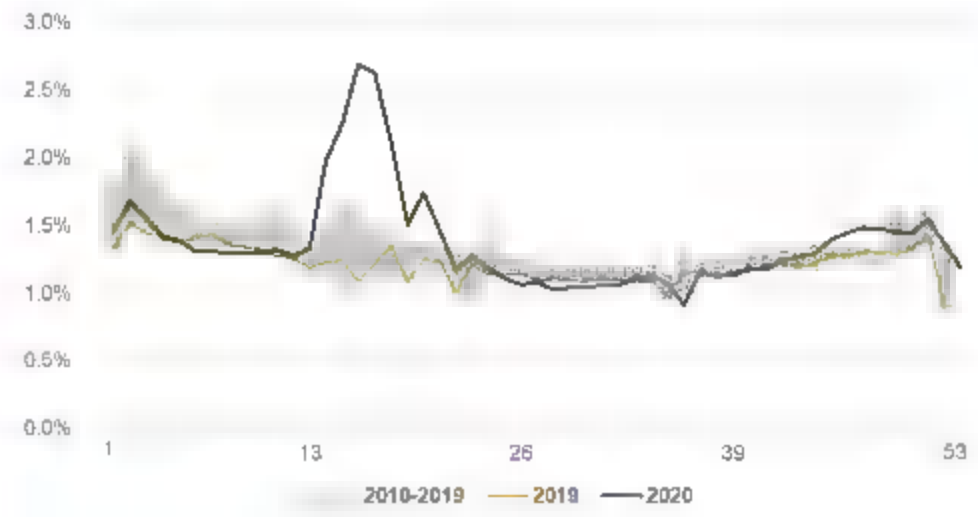
Would someone kindly guide me to the GLP reproductive toxicology reports & the clinical experience in pregnancy which surely underwrites the statement seen in the image below?
Quite a claim so there'll be much data to support it.

The coronavirus vaccine developments have so far reported no major side effects or problems *Picture: PA*

Can pregnant women have the Covid vaccine?



Any vaccine that gets approval has to be certified safe by a number of regulators meaning, should any of the treatments be approved, there will be no major side effects to worry about.

However, despite those guarantees, those who are pregnant or breastfeeding have been told to discuss the vaccine further with their GPs.

mortality by week, compared to the range in the equivalent week over the previous 10 years. Care needed again when comparing the latest week to previous analysis, due to Bank Holidays.

6 33 76

Stocks @stockypig · 1 Std.

With such a huge spike early in 2020 without Covid now you'd expect a really low level for excess mortality this winter (many vulnerable have passed away). But it's high, so showing that the virus remains a dominant force and taking people who wouldn't normally die.

Matt, a helpful thread, thanks. One thing & maybe it just a visual thing. At week 52, the trace seems a long way below week 1. That is, if week 1 was similar to week 52, it appears to me it'd be lower than the typical week 1 value. I'm pretty sure I'm reading it wrong!

GAB @CatrionaCollins @CatrionaCollins · 5 Std.

The difference is not 1000. It's 636 over the two quarters. The 3rd & 4th quarters had lower than average mortality. You're going to be pushed to get a global pandemic out of that. 183 extra in Q.1 is not of consequence.

If you look at absolute number of deaths, 2020 ranked #5 out of the last 30.
I have not ranked it by deaths as % total population but when that's done, it'll rank much lower. Definitely much by way of excess deaths but let's not spin it.

I've greatly admired Dr Atlas' clear & current understanding of viral immunology. I doubt many political appointees in the sci / med field read as many original research articles as he evidently does. Please keep contributing. Your ignorant peers know they're wrong.

> **Abir Ballan** @abirballan
> @ScottWAtlas has been attacked ruthlessly by a politicized media and, worst yet, by his academic peers in a blatant attempt to shut down independent, credible scientific opinion.

No - that's the crime of "mingling"

It depends

Correct!

It depends. A previous version of England's lockdown laws banned "mingling" - leading to Home Secretary Priti Patel warning families not to stop and chat while out shopping. The existing law does not ban chance encounters - but you are not allowed to organise a "gathering" - which means more than two people. So if the police can show you have deliberately got together, you could get a £200 penalty. But in this case, you may have the "reasonable excuse" that it was a chance meeting with no intention to break the law.

MAJOR problem for authorities arguing for restrictive 'measures', as findings are they're ineffective (unless the goal is destruction, in which case, they're extremely effective).
I've been sceptical because of lack of evidence. Now it's worse than that.

the other 8 countries (16 total comparisons).

Results

Implementing any NPIs was associated with significant reductions in case growth in 9 out of 10 study countries, including South Korea and Sweden that implemented only lrNPIs (Spain had a non-significant effect). After subtracting the epidemic and lrNPI effects, we find no clear, significant beneficial effect of mrNPIs on case growth in any country. In France, e.g., the effect of mrNPIs was +7% (95CI -5%-19%) when compared with Sweden, and +13% (-12%-38%)

...
frontiersin.org/articles/10.33 ...
We also have clear evidence that our own 1st lockdown didn't terminate the pandemic.
It was self-limiting.

If you think locking down the population is more effective in reducing excess deaths, there are tens of thousands of people who'd like to hear your well evidenced reasoning. Ideally with peer reviewed journal articles. Because I cannot find any evidence that it's true. None.

Extremely good summary from Liam Fox. Statistics can be used to distort messaging but that doesn't make either untrue. Thinking & careful listening / reading will solve for yourself.

15 So what's my point? My point is that there is NEVER one side to a debate. My concern for patients started me on this journey. My distress at the damage we are doing to our children, our mental health, our economy, our long term health.

1 3 27

Renee Hoenderkamp @DrHoenderkamp · 24 Min.
16 Make no mistake, poverty breeds ill health and that lasts for decades. Recession kills. As a doctor, I care about every single person in society. I am not suggesting it's easy. I cannot be not sure that my suggestion of a different approach is the right one.

2 3 33

Renee Hoenderkamp @DrHoenderkamp · 24 Min.
17 But we have to be able to discuss it, look at the evidence, critique all arguments. Rather than just shout & abuse without actually addressing anything. No view is right or wrong, just different. Nobody is happy (i hope) to see anyone die so we argue for the same end result.

What you've just described doesn't meet the legal, regulatory or common understanding of the intervention, "Vaccine".
Given that, what is a fairer description of this class of molecule?

Royce Jacob @Royce_P_Jacob
Antwort an @Fatherspyridon @robinmonotti

Help:
The "vaccine" wont keep you from contracting SARS-CoV2.
It wont stop you from getting Covid but will "lessen severity of symptoms".
You can (supposedly) still spread the virus while asymptomatic....

None of this is going to be as scientically certain as information about "infected or not", but it could give us some quantities which allow us to more honestly summarise what we know about infectiouness and how certain we are about it.

1 10

Jon Deeks @deeksj · 23 Std.
Putting this out there for thoughts and reactions?

Antwort an @deeksj

Given asymptomatic transmission is a rare even & not, as pretended 1st time in 2020, important, mass testing is superfluous & is responsible for huge harms.
Invite those with symptoms to self isolate & apply social opprobrium. It'll work well & humans will regain that status.

Alan McNally @alanmcn1 · 6 Std.

Clearly early days but encouraging if trend persists. More LFD +ves in 1st tests than repeat tests suggests LFDs are not "missing" early infections.....

Date	1st test Pos	1st test Neg	2nd test Pos	2nd test Neg
05/01/2021	2	687	0	1
08/01/2021	3	372	2	282
11/01/2021	0	450	0	172
15/01/2021	5	275	1	201

9 16 85

Curious Sceptic @Bernp1953P · 4 Std.

Interesting. Progress towards agreement on relative value of PCR vs LFD?

1

Jen @leoniedelt · 4 Std.

Both totally inappropriate for asymptomatic aka healthy people, and inappropriate in schools as some kind of mass screening.

I've seen the clinical evidence summary of the effect of ivermectin in prophylaxis & treatment of SARS-COV-2 infection & the resulting disease, covid19. It is safe, cheap & a self administered oral tablet. At very least it should be available for use in UK on an off label basis.

It's not my summary & I hope it'll shortly be widely shared.
If you do a quick search, you'll find numerous trials, some of which are of decent size. I think it's profile is impressive.
I wonder if Mr Hancock has read even the executive summary?

implementing any NPIs was associated with significant reductions in case growth in 9 out of 10 study countries, including South Korea and Sweden that implemented only lrNPIs (Spain had a non-significant effect). After subtracting the epidemic and lrNPI effects, we find no clear, significant beneficial effect of mrNPIs on case growth in any country. In France, e.g., the effect of mrNPIs was +7% (95CI -5%-19%) when compared with Sweden, and +13% (-12%-38%) when compared with South Korea (positive means pro-contagion). The 95% confidence intervals excluded 30% declines in all 16 comparisons and 15% declines in 11/16 comparisons.

Conclusions

While small benefits cannot be excluded, we do not find significant benefits on case growth of more restrictive NPIs. Similar reductions in case growth may be achievable with less restrictive interventions.

Dangerously wrong because, amid much uncertainty, and despite the relentless messaging on handwashing, one thing that's become very clear about the coronavirus is that it doesn't spread much by fomites. Researchers have been hard-pressed to find many examples of outbreaks that can be traced to a contaminated surface (there are only a couple of possible exceptions). The Centres for Disease Control in the US have

Anyone else confused?
Covid is airborne we were told. Then it can stay on surfaces for days. Boris just went on about surfaces. Yet back in november when the london underground was tested, not one trace of a covid virus in the air or on any surfaces? How?

Last year, there was and remains substantial uncertainty about the contribution of airborne transmission. I have not seen one peer reviewed paper showing virus cultured from air vents & filters even in hospital wards. Some PCR positive tests but not infective virus.

There have been some spreading events reported (a choir practise in the US was one famous example) where airborne transmission did seem the likely inference. However the majority of transmission didn't require that route. Yet few cases exist proving surface (fomites), either.

2019 WHO guidelines look reassuringly sane. For viruses which mutate much faster. I note with interest that we're doing most of the "not recommended under any circumstances" list. Weak minded individuals will no doubt create a comforting narrative.

Table 1. Recommendations on the use of NPIs by severity level

SEVERITY	PANDEMIC[a]	EPIDEMIC
Any	Hand hygiene Respiratory etiquette Face masks for symptomatic individuals Surface and object cleaning Increased ventilation Isolation of sick individuals Travel advice	Hand hygiene Respiratory etiquette Face masks for symptomatic individuals Surface and object cleaning Increased ventilation Isolation of sick individuals Travel advice
Moderate	*As above, plus* Avoiding crowding	*As above, plus* Avoiding crowding
High	*As above, plus* Face masks for public School measures and closures	*As above, plus* Face masks for public School measures and closures
Extraordinary	*As above, plus* Workplace measures and closures Internal travel restrictions	*As above, plus* Workplace measures and closures
Not recommended in any circumstances	UV light Modifying humidity Contact tracing Quarantine of exposed individuals Entry and exit screening Border closure	UV light Modifying humidity Contact tracing Quarantine of exposed individuals Entry and exit screening Internal travel restrictions Border closure

NPI: non-pharmaceutical intervention; UV: ultraviolet.

People know I'm claiming nothing more than surviving simple virus infections leave you immune. You may be technically reinfected but mount faster stronger immune responses & don't get ill.
This is what I was taught in 1st term immunology in 1981 & it was old news then.

This isn't funny. Please listen: recovery from simple respiratory viruses (not fast mutating like flu or immunotoxic like HIV) leaves you IMMUNE.
No ifs or buts, we've known this since before my undergrad text, Ivan Roitt, Essential Immunology (2nd edition). I've still got mine.

Now we know, from peer-reviewed journal articles, that lockdowns do not sufficiently slow transmission or reduce mortality sufficiently to get close to justifying the damage, including increased deaths, arising from them, we can conclude that proponents are WRONG & should stop.

Definitely. Ridiculous they've been getting away with announcing case numbers based on it for so long. Also ridiculous is them announcing case numbers instead of % positives when testing's been increased 50-60 times. Of course you'd expect more "cases" but you can't compare.

4 7 34

That one is particularly offensive because it is only the PCR mass test which has no equivalent to an MOT. No one knows the operational false positive rate. All we know is it isn't zero. Govt takes every positive as a 'case' when we can be certain thats incorrect.

limit for PCR positivity. In some cases, the IFU will state that the cut-off should be manually adjusted to ensure that specimens with high Ct values are not incorrectly assigned SARS-CoV-2 detected due to background noise.

Manufacturers regularly review the design of their product, including labelling and IFU based on customer feedback. In the early phases of the COVID-19 pandemic, in vitro diagnostics (IVDs) were rapidly developed, validated and verified, and then rolled out. Therefore, it is not unexpected that IVDs may require refinement based on user feedback after their introduction at scale. Users should verify the version of the IFU with each consignment they receive to see if any changes have been made to the IFU.

The evidence is quite clear: the way most people use cloth face coverings promotes lung infections. There's no uncertainty about this: it leads to a doubling of lab confirmed lung infections. Likely there'll be deaths flowing from this lethally incompetent advertising.

The original large RCT, largest prior to Danmask. Shows no protection against respiratory viruses either.
So why 'face coverings' are legally required is a mystery. This evidence is almost the first hit you find, so SAGE knows it.

KEY POINTS

- Sweden appears to be changing tack and implementing stricter measures as a second wave of infections takes hold and hospitalizations rise.
- The country was infamous for not imposing a lockdown during the first wave of the coronavirus pandemic,

Antwort an @juddyjamesbrown @ianbrown

How did you reduce that Australia's outcome & it's policies aren't causally related? If they'd all started standing on their heads at the same time, would you have claimed that caused the pandemic to wane? Of course not. So you need evidence to link lockdown & virus mortality.

Antwort an @Cbr250honda @JonOther

Multiple studies have shown that lockdowns do not significantly reduce transmission or reduce mortality, that's why not.
Respiratory failure is ghastly. But it's not prevented by lockdown, which independently is strongly associated with excess non-covid19 deaths. Wake up, please.

@MichaelYeadon3
Folgen

Antwort an @itvnews @MattHancock

The primary endpoint in all the vaccine trials is PCR positivity accompanied by non-specific symptom reduction. Good, but no evidence at all against death or transmission. Mr Hancock: the reason lockdowns should end is they're proven NOT to save lives. You're operating a lie.

No variant is proven to be more harmful that the original. The trend of respiratory viral evolution is to lower lethality & greater ease of transmission, which is consistent with there being 40 viruses which cause symptoms of the common cold.
You're fighting evolution, just stop

Like can you give us an alternative to lockdown. Or is it just carry on as normal and let people die.?

11 11

Tina @ElContador2000 · 18. Jan.

No, there is simple solution. Lockdown the elderly and most vulnerable and everyone else gets on with their lives, rebuilding the economy. If not we are all going to die anyway.

2 5 8

me @Gerard0207 · 18. Jan.

What do we do if the elderly and vulnerable live with people not in that group? What about the care homes and hospitals where the elderly and vulnerable need care and attention? Do we isolate these poor people and seperate them from society?
I need a more datailed plan.

1 2

Tina @ElContador2000 · 20 Std.

Only if these 'poor' people agree. I am happy to remain in lockdown for the greater good. Are you?

1

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @ElContador2000 @Gerard0207 und 3 weitere

No, because that's killing 1400-1800 extra people per week from non-covid19 causes (deprivation of healthcare).
Lockdown as we do it has an imperceptible impact on transmission anyway.

results when testing specimens using RT-PCR reagents on open systems.

As with any diagnostic procedure, the positive and negative predictive values for the product in a given testing population are important to note. As the positivity rate for SARS-CoV-2 decreases, the positive predictive value also decreases. This means that the probability that a person who has a positive result (SARS-CoV-2 detected) is truly infected with SARS-CoV-2 decreases as positivity rate decreases, irrespective of the assay specificity. Therefore, healthcare providers are encouraged to take into consideration testing results along with clinical signs and symptoms, confirmed status of any contacts, etc.

Users of RT-PCR reagents should read the IFU carefully to determine if manual adjustment of the

There are some excess deaths; low in number. Strong evidence of over-attribution to Covid19 of cause of death, specifically in autumn / winter. This judgement is independent of any PCR test. Marked falls in deaths by all other cause is its hallmark. Telling of problems with PCR.

Whilst I have your attention - what would you suggest, in your professional opinion, caused my father's death, 10 days ago, at Darent Valley Hospital? He had what he thought was a bad cold, he became extremely hypoxic, his lungs filled with fluid and he died 3 days later?

3 2

Al Cooper @AlCmarmite · 16 Dec 2020
No underlying co-morbidities except osteoporosis. Two weeks before he died he was redecorating parts of his house and gardening daily. Do you think he may have contracted a lethal pathogen during his weekly trip to Sainsburys?

SAGE is not a person to be "fired". You don't appear to have a clue what you are talking about. It is a network of committees, membership adjusted to bring in expertise as required. You don't have the requisite expertise, in most if not all the areas upon which you pontificate.

No. That is not the case.

The lower the Ct (in a specific setup), the more viral RNA you have extracted from the swab. It MAY correlate with the amount of virus there, or it may not. Swab quality etc will also impact it.

1 1

InCytometry - Graham Bottley @InCytometry · 16 Dec 2020

The reason that interpretation and Ct etc are very specific to a lab is that they will run all sorts of controls at the same time to help them interpret the data. This will be done continuously.

However, unless you are a specialist in the technique, it is very black box.

2

InCytometry - Graham Bottley @InCytometry · 16 Dec 2020

It would be like asking airlines to provide data on engine temp of every jet they ever fly to prove that some airlines are wasting fuel.
A jet engineer can assess that data, but anyone else cannot process the nuance and specifics to make an informed conclusion.

That is complete and utter babbling nonsense. There are by definition virus free samples in every PCR run. Otherwise every sample would test positive.....

Replying to @alanmcn1 @ClareCraigPath

Dr McNally, this is a great opportunity to outline where in the process (in addition to plate controls for the PCR step) you routinely place your negative controls.

Bulk oppty for cross contamination is from opening bags with leaky swab tubes to the receiving tubes.

Ta, Mike

By "scientists" I'm gonna assume you mean SAGE, where 12 of 20 plus Whitty & Vallance have conflicts of interest. Never mind the fact there isn't a single virologist or epidemiologist on SAGE! I'd be inclined to believe Tice & pub mates who've done independent research over SAGE!

Replying to @sparky1980m @Frenchywilson @TiceRichard

It was immunology, especially cellular immunology, which was deficient in spring.

It's claimed they're on SAGE now, but I've seen no evidence they're involved in debate.

So many basic rules of immunity have been discarded that, if it wasn't so serious, it would be laughable.

Unfortunately you are peddling the government line, that there were excessive deaths in March/April they simply changed the way they counted from recording actual deaths to registering deaths over a longer time frame. False from start to finish.

Angela,
That's an interesting idea but consider the number of deaths records they'd have to hide / store up in order to release them later? Also, synchronising with simpler releases to EuroMOMO would get messy. Why do you say what you do?

I think it's a reference to deaths from covid then attributed by Public Health England outside of 28 days even it was from another cause, a correction to this was won by Professor Heneghan so that covid could only be attributed to cause of death within 28 days of a positive test.

1

Yardley Yeadon @MichaelYeadon3 · 17 Dec 2020

I see that lowering it to 28d is more reliable than open ended!

Replying to @ninekeanes @alanmcn1 @ClareCraigPath

Based on evidence from a highly experienced expert in this very technique I'm sure that (1) no process-related virus-free 'negative controls' are run (in MK Lighthouse Lab) & (2) a plate control in PCR purports to be the whole process negative control. That's a deception.

No. The nation been at herd immunity since December & London since late spring 2020. This is why excess deaths were low to zero for London 3-4Q2020. That there were thousands of deaths attributed to covid19 merely confirms how untrustworthy is PCR mass testing. It's now endemic.

It's reassuring to see WHO finally advise not only that at low prevalence, even a modest-looking FPR undermines testing integrity, but also question testing those without symptoms. Lots more in the 20 page document & annexes. I expect it'll be ignored.

Dr Naomi Wolf @naomirwolf · 8 Std.

So many furious small business owners are contacting me now that it's confirmed via @who that data used to justify shutting them down, is based on a test that is formally identified by @who as not fit for diagnostic purposes due to its scale generation of false positives.

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @naomirwolf @WHO

Dr Wolf, agreed! Did you know that, as far as I can tell, not ONE of the organisations has ever disclosed a value for operational false positive rate. It's invalid to use a diagnostic test without this, yet we are repelled even for demanding to know what it is (& it's variable).

Good news. A courageous judge has struck down a fine on a person who'd breached certain Covid rules, on grounds that these aren't evidenced at all (benefits outweighing the negatives) & represents overreach by the authorities.

I can't help but feel sadness at this news. I was born in an era of American automotive excess & European style, both of which were challenged by Japanese quality improvement. I'll exit along with ICE. The "freedom of the open road" rings hollow in any case.

If you're willing to review published literature there's almost no study which finds other than that lockdowns do not reduce mortality & they all cause deaths & poverty.

Yes there are horrendous consequences but, and I respect your position, why would the government and its advisers risk the effects on the economy and the consequences if you t didn't ease the pressure on the NHS?

2

Hazel @hfereid · 19 Dec 2020
Funny, my sister asked me that same sort of question last night. I couldn't answer her as I reflected on the enormity of how our governments are so hastily shutting down our economy. Maybe the experts on here will be able to assist?

Reuven Chatzkel @ReuvenChatzkel · 20 Dec 2020

Why is it we so rarely hear of successful interventions on main media or at press conferences, ostensibly to assist public health?
No mention of Vit D, of chloroquine (cheap generic for malaria) or ivermectin (cheap generic for parasitic infestation)?
It's almost as if SAGE...

...is not really interested in public health after all. OTOH, perhaps not so surprising. SAGE isn't a public health body & is horribly under qualified to be so. What they're expert at, I can't tell. Not our best interests, that's for sure.

Wonderful thread, Dr Simon! Thank you. The authors of the uninvited peer review of the paper filed an Addendum to the Corman-Drosten Review. It's on its own server, which is why it's not censored. It addresses all criticisms of the original C-D Review & is more powerful still.

It's yet another "Why?" to be added to myriad other questions, most of which don't have compelling answers that make sense. Lockdowns are proven not to do what is expected of them, to significantly reduce transmission. They do kill, though.

Dr Clare Craig @ClareCraigPath
If SAGE didn't propose lockdowns then who did?

This report is truly shocking. SAGE did NOT recommend lockdown. They didn't even discuss it.
Ask yourself, "Why are we allowing this?" & how did we get here, using a destructive intervention which is proven not to work? Now on its 3rd, lethal cycle?

that the Government has released the minutes of the SAGE meetings in the period leading up to the lockdown announcement on March 23rd – this was on Friday as a direct result of Simon Dolan's lawsuit – we can get closer to answering this question.

The former barrister Paul Chaplin has gone through the minutes in a lengthy blog post and concluded that placing the entire country under virtual house arrest was a political decision and not "based on the science". His analysis is compelling.

Chaplin finds plenty of evidence in the minutes that various different containment measures were discussed by SAGE, but at no point before March 23rd did the group recommend the quarantining of the whole

It's worth stating what's well understood because the WHO's edited description of herd immunity recently deleted reference to naturally acquired immunity. Modelling papers simply leave it out, leading to the completely wrong conclusion that everyone needs vaccinating to reach HI.

How do you think this all ends?

The innovations in therapeutics will start to cut the death rate, but the true end will come from the spread of natural infections and the vaccine giving us herd immunity. For rich countries, that will be sometime next year, ideally in the first half. We'll get out of this by the end of 2021.

So we're going to be OK?

Certainly. We're lucky this one wasn't a more fatal disease.

Yet again this shows what we all know: not so much garbage in, garbage out, but “slyly leaving out vital parameters or adopting unreasonable starting values can yield whatever you wanted”.
Another example is “510,000 people will die, unless...”.
That one’s currently killing U.K.

Imagine what this does to positivity? It ramps up much more steeply than the change in true prevalence. Now map this back to the claims being made for the variant. You've got chaff, not reliable data. Nothing solid upon which to base any Ferguson / Preston scare stories.

I find it distinctly odd that WHO has amended its description of herd immunity to exclude naturally acquired immunity from infection by viruses.
Yet it's very common to get robust & durable immunity this way.
"How the chickenpox vaccine works:

The chickenpox vaccine is a live vaccine and contains a small amount of weakened chickenpox-causing virus”

Look how powerful immunity is & it’s gained by infection in this case.

So reject the anti-science idea that natural infection by SARS-COV-2 won’t produce immunity.

How effective is the chickenpox vaccine?

It's been shown that 9 out of 10 children vaccinated with a single dose will develop immunity against chickenpox. Having 2 doses is recommended, as this gives an even better immune response.

The vaccination is not quite as effective after childhood. It's estimated that three-quarters of teenagers and adults who are vaccinated will become immune to chickenpox.

Read answers to common questions about the

But cases are now falling, as are hospital admissions. You can see the effect of each lockdown we've had.

I don't know if you've had a chance to look at the extensive literature showing conclusively that lockdowns do not & have not slowed transmission or been associated with reduced mortality?
A compelling peer review paper by Ioaniddis & Bhattacharya just out:

No one is infallible but these two are among the most eminent in their fields. They've looked carefully in a very reasonable way & there just isn't the notable dips we'd all like to see - given we've committed to it!
Also & pls don't shoot me - UK = SWE.

There aren't many fields where predictions & outcomes can be so far apart yet a Practioner remains central to such events. In fact, I can't think of another example.

I am in awe of those who sincerely believe that, as we practise them, not some theoretical construct, lockdowns reduce transmission & reduce mortality. If this was true, there'd a numerous, sizeable examples in peer-reviewed journal articles. There aren't. To the contrary.

> **DocDM** @DocDM4
> Replying to @Mark_Logan1 @devisridhar
> "We know lockdowns work" is a completely false statement. Please cite refs.

I understand your theoretical approach & I agree that, if human contacts were sufficiently reduced it would prevent transmission. But that belief is not the same as saying "lockdown reduces spreading". Here's the latest study of what actually happened:

antibodies. However, if this were to be the case this would then also prevent the formation of a placenta which would result in vaccinated women essentially becoming infertile. To my knowledge, Pfizer/BioNTech has yet to release any samples of written materials provided to patients, so it is unclear what, if any, information regarding (potential) fertility-specific risks caused by antibodies is included.

Francois, sequence homology is not long but it is there. For example VVNQN vs VVLQN in CoV-2 vs Syncytin-1. There are others. While not striking, 'what if' a polyclonal response includes cross-reacting antibodies? And motifs this small can give rise to cross-reacting antibodies.

Of course not the only grounds. You can read them in the summary.
A series of concerns, coupled with speed, added to which an unusual response from the authorities (who appear keen to vaccinate well beyond the vulnerable pop) add up to cause me anxiety.
Have you none, yourself?

I understand Robin Monotti is a Nobel nominee, the sort of person who, in U.K. would be told to keep head down if he wants the prize.

He hasn't. Reportedly he saw that Italy was driving Covid19 policy off single gene, high Ct 'positives' in PCR mass testing & objects.

Respect.

I'm genuinely fearful of those arguing for policies intended to reach "zero covid19". This isn't far from "zero influenza" & that isn't a practical option nor is it faintly necessary. There's an unawareness that there are scores of human viruses & around 40 respiratory viruses.

> **PCRclaims** @pcrclaims
> @UKLabour is obsessed with censoring anti-vaxxers, ok fine. Could you also be obsessed with censoring more dangerous zero-covid myths too and those who deny herd immunity cannot be reached without a vaccine @DrRosena ??

Don't shoot. Blog is by deputy editor of the BMJ. In brief, headlines can sometimes not fully reflect the underlying data.
To be completely fair, I've nowhere read an analogous story about AZ product. So the 8% number is mystifying.

With these new imposed travel restrictions and quarantine prisons what happens for charity workers? Many charities have small budgets and have to travel to some of these 23 countries. I wonder how many "high value" travellers will not be forced to quarantine in the same way.

Antwort an @eckypeckypoo @hartgroup_org

Don't worry. Within a few weeks, no one but those with executive jets & test-free passes will be moving about. The rest of the population can enjoy themselves window shopping for foreign holidays we won't be taking. Once quarantine hotels are in place, flights will all but stop.

Clive Townsend @CliveTownsend3 · 26. Jan.
Hi Zoe
I have a question for you.
How do they test for the different variants of covid.
My understanding is that the pcr test is very limited.
So how can they know who has what variant and therefore which variant is doing what?

Is there another test?

6 2 15

Yardley Yeadon
@MichaelYeadon3

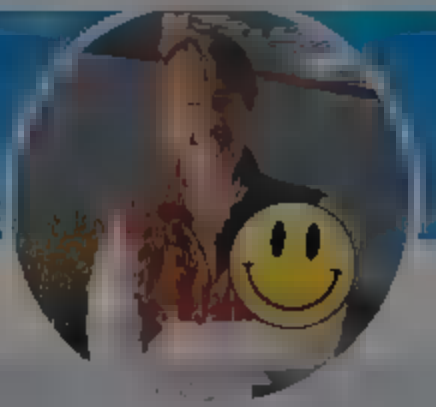
Antwort an @CliveTownsend3 @zoeharcombe



Some mutations have occurred in spike, and by bad luck, the PCR primers ('bait' to find the matching sequence in the viral DNA formed by reverse transcriptase) no longer bind well there. So two gene (N+E, I think) PCR positives which are S negative are called variants.

I'm aware that this low-fi technique is used in high throughout screening mode, but a sample (not all) of such two gene positives but S negative results are sent for full sequencing. Even that's not perfect but it's a great deal more secure than this 'rough & ready' method.

Important to narrow that statement to “stable respiratory viruses”. Then it’s true, generally. We’re it not true, each person would find they’re simultaneously infected with many such viruses. Ps: coronaviruses belong to the category of (relatively) stable viruses, unlike flu.

Unlikely: lockdowns, masks, testing & tracing.
Love their Moonshot. We've some potential passengers to add to the manifest

> In the year since then, Thailand has recorded an overall death toll from Covid of 72. Not 72,000, but 72, from a population slightly larger than the UK's. To put that in perspective, more Thais die on the roads each day than have succumbed to Covid in all of the past 12 months. In fact, all-cause mortality in Thailand in 2020 was expected to be greatly reduced as travel restrictions dented the normal carnage on Thai roads, which claims over 25,000 lives a year.
>
> Covid, for some reason, has not caught on in Thailand. This is not to suggest that the Thai government is somehow more than 1,000 times more efficient than the UK Government

Didn't Covid19 more or less disappear during the summer? Yet the blue bars continued, indicating they're not due to Covid19?
It's almost as if we've changed something, which has caused 43,000 more people than usual to die at home in the last 45wks or so.
What could that be?

Note that there are several papers showing pre-existing T-cell responses in pre-pandemic donors & that recognition sites in SARS-CoV-2 are shared with homologous sites in endemic (common cold causing) coronaviruses. Analogous findings in antibodies are unsurprising but cool.

Bottom line is, taken with T-cell findings there's good evidence of population-wide prior immunity. It's debatable what fraction of the population had functional immunity but I find compelling the suggestion that it was a substantial proportion & that this varied geographically.

I will say, revisiting some of the literature, it's not a uniform finding that there are unequivocal, shared T-cell epitopes between common cold producing coronaviruses & SARS-COV-2. Some do, however, as here:

What this truly brilliant paper shows is that there are numerous, different peptides, short pieces of the SARS-CoV-2 virus, which give rise to T-memory cells. These are in common to T-cells from SARS survivors 17y ago, suggestive of LONG LIVED immunity to SARS-CoV-2.

The reason I get cross with pseudoscience BS about variants "escaping immunity" is in this paper. There are so many different nucleocapsid peptide epitopes recognised by our memory T-cells that's there's no chance that small alterations from variants escaping recognition.

I wonder if spike may not have been the optimal target for vaccines. Not my field, and it is 20/20 hindsight, but I'd choose nucleocapsid sequences recognised from both SARS & SARS-CoV-2 due to evidence of durability. Ideally of course, you use whole virus, no guessing needed!

Just four students tested positive for Covid last week in Cambridge's asymptomatic testing programme - University of Cambridge

4 of over 3500 students without symptoms "tested positive". Definitely worth destroying the country for & closing borders.

Yardley Yeadon @MichaelYeadon3 · 2 Std.
The reason I get cross with pseudoscience BS about variants "escaping immunity" is in this paper. There are so many different nucleocapsid peptide epitopes recognised by our memory T-cells that's there's no chance that small alterations from variants escaping recognition.

6 21 86

Yardley Yeadon @MichaelYeadon3 · 2 Std.
I wonder if spike may not have been the optimal target for vaccines. Not my field, and it is 20/20 hindsight, but I'd choose nucleocapsid sequences recognised from both SARS & SARS-CoV-2 due to evidence of durability. Ideally of course, you use whole virus, no guessing needed!

4 9 29

Martin Nicholls @streaky81 · 2 Std.
Well the object of the exercise is to work with the immune system, right? If you're doing that you chose the path of least resistance, namely training it to recognize the spike, agglutination and go next. Seems logical to me.

1

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @streaky81

Martin, absolutely agree, though I merely noted that the immune system appeared in the case of SARS to have lodged long term memory aimed at a range of peptides in nucleocapsid. I expect spike would also work. Would you choose spike because encountering it is inevitable?

US children will 'hopefully' get vaccines in late spring or early summer, says Fauci | US news | The Guardian

Children repel this virus at no risk & they develop broader immunity than from a vaccine.

Implausible any medical intervention will be safer.

It's useful to have context, whatever is available, to help us interpret effects of NPIs. Here's a list of US states which have remained largely open during the autumn/winter with the dates that their "cases" went into decline, with notable consistency.

11:07 - 31. Jan. 2021

1

Yardley Yeadon @MichaelYeadon3 · 6 Sek.
First, UK cases have been declining since Jan 10th.

Florida: Cases declining since Jan 12th
Georgia: Cases declining since Jan 14th
South Carolina: Cases declining since Jan 19th

1

Yardley Yeadon @MichaelYeadon3 · 6 Sek.
Texas: Cases declining since Jan 16th
South Dakota: Cases declining since Jan 9th (main peak on Nov 17th)
Utah: Cases declining since Jan 10th
Nebraska: Cases declining since Jan 10th (main peak on Nov 20th)
Iowa: Cases declining since Jan 11th (main peak on Nov 13th)

1

Yardley Yeadon @MichaelYeadon3 · 5 Sek.
Wyoming: Cases declining since Jan 17th (main peak on Nov 23rd)
Arkansas: Cases declining since Jan 11th
North Dakota: Cases declining since Nov 18th

It's worth tracking such trends, while trying to work out whether claims that 'lockdown is working' are well-founded.

These two doctors are knowledgeable about ivermectin, an off-patent (generic), low-cost & generally well-behaved oral molecule, with a long history (billions of doses) of use against parasites, which is proving "miraculous" in covid19. It must be made available ASAP.

... test in follow up, neither were symptomatic.

This is exactly what you'd expect from simple immunological principles. Infection with a respiratory virus leaves a person immune. Immunity doesn't mean that a virus can't enter your body but it does mean it won't make you ill.

00:34 - 3. Feb. 2021

1

Yardley Yeadon @MichaelYeadon3 · 13 Sek.
Obviously, we must be careful with terms. Being positive by PCR is not the same as being clinically infected.
Encouraging to see evidence that human immune systems handle this virus exactly as prior experience predicts.

Tommy may be a truth teller now, but there was a time when he didn't like immigrants purely because they're immigrants. I don't share that view at all. We are on the same page regarding Islamic extremism, whether home-grown or imported.

Interesting paper on immunity in Orthodox Jews. As with all antibody studies it matters where you put your thresholds.

Plenty of prior immunity included here. Would be interesting to see same methods on general population.

We know that previously infected don't get re-infected with the virus (Gerlis TalkRadio 02/02/21) & others.
We know that the virus was around in Autumn 2019 & unchecked until Spring 2020.
We know many people have been tested positive since the start of Covid, & recovered. (1)

I am pretty sure I came down with it in November 2019.
I had a short bout of a flu-like illness followed by having to pause at the top of stairs because of breathlessness for around a week.
I remember because I had never before experience breathlessness like that.

Kevin Ryan @kevinmartinryan · 40 Min.
Am not suggesting this would provide a different (or even illuminating) answer, but why are you comparing 999 calls/triages to deaths, as opposed to, say, hospital admissions, which I would have thought would be a more adjacent event to the call?

1

Prof Norman Fenton @profnfenton · 30 Min.
Because hospital admissions includes people admitted for reasons other than COVID, whereas 999 calls here are specifically related to COVID

1 1

Kevin Ryan @kevinmartinryan · 26 Min.
It was the COVID admission figures published daily by the NHS that I was referring to. Is there a problem using that data?

1

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @kevinmartinryan @profnfenton

I believe 'covid19 admissions' includes all patients admitted who have a positive test, regardless of the medical reason for admission & also those testing positive AFTER admission. So a few problems, yes.

Thank you. This is blatantly obvious. The goalpost will not move because we can't put up with this nonsense any longer. Protect the vulnerable and then we need a staged return to FULL normality

2 8

Pobol Pobotrol @pobotrol · 35 Min.
If you let the virus run wild through the population it will mutate and then we can never protect the vulnerable or return to full normality. It is essential to keep transmission rates as low as possible.

3

Yardley Yeadon
@MichaelYeadon3

Folgen

Antwort an @pobotrol @MarcusSantiagoZ @Telegraph

Nonsense. Protect the vulnerable then actively encourage transmission. That way you'll see minimal deaths & rapid herd immunity. Do note that 30% of pop have been infected already. So closer to the end than the middle.

Every intervention should be tried. There are many others which tragically our & other Govts have turned the faces away from, almost as if they've a reason to do that.

David Davis @DavidDavisMP
The death rate in Andalucía almost halved following the introduction of their Vitamin D policy. Tragically, here in the UK our death rate more than doubled over the same period, despite us having 5x the vaccinations.

I've been in touch with five U.K. university professors in departments which means they're knowledgeable about immunology. All of us agree that the variants will not meaningfully alter immune recognition by our bodies of the virus. If you've been infected by the Wuhan...

Update to Sweden.

Positive tests now nearly 60% < peak: a similar drop to that seen in the UK despite many schools in Sweden being open, pubs & restaurants too though with restrictions.

New ICUs down by even more. Deaths below peak too, but as always beware later updating.

I'd expect a VERY solid relationship between Covid19 deaths & excess deaths, wouldn't you? There isn't. Nothing like. How can that be? Worse, as they point out, in sone areas there's excess deaths but few Covid19 deaths. That's got to be 'policy deaths' = lockdown, surely?

Saving Scotland Edinburgh Group @scojw
Finally scatter plot confirming graphically and by equation the current relationship between change in mortality rate, and deaths attributed to covid.
That may change, but we should note areas of raised mortality…

Interesting legal case against the federal department of health & human services, essentially asking them to explain themselves & to be honest with the people. There's a novelty.

Ask the Court to Order DHHS to Produce the Facts

"We are now asking the Court for a Temporary Restraining Order (TRO) and a Show Cause Order. It is well past time for DHHS to explain why they have issued rules to inflate cases and death counts."

02/03/2021, USA and Ohio – In March of 2020 the DHHS took the unprecedented step of issuing a new rule for the way COVID-19 deaths were counted. This rule created a system that counted COVID-19 deaths differently from ANY other cause of death and that would result in "COVID-19 being the underlying cause of death more often than not." The result is that deaths from COVID-19 have been dramatically inflated as compared to any other cause of death.

To make matters worse, the DHHS and state partners then began using "case counts" for COVID-19 as a method for determining policy. This was done using PCR testing as a basis for diagnosis despite the fact that most test kits include disclaimers stating that they should not be used to diagnose COVID-19 (this was submitted to federal Court).

Under federal law, the presentation of statistics must be done in a way that ensure the integrity, quality, and utility of the Federal statistical system. The new motion, filed 2/3/2021 requests a TRO and that DHHS show cause for these actions which undisputably are not meeting the integrity, quality, and utility standards required.

"While we recognize that COVID-19 is a real virus that has hurt and killed people, it is undisputable that the response has always been focused more on fear than science. We strongly believe that policy and personal decisions about protecting yourself and your family should be made with honest data and not based on misleading information presented to stoke fear."

It is time for the "COVID agenda" to end and science to step in.

I can't say this is a surprise. Was intrigued to see what thin excuse this now disreputable journal, Eurosurveillance, would come up with. It's thin indeed.

Bobby Rajesh Malhotra ツ @Bobby_Network
We received an official response by @Eurosurveillanc - the outcome is a complete joke after 2 months "review"-time:

- Justifiy bad science w/ "time-pressure"-issues...

review. This has also been the case for a maximum of two regular articles per year. *Eurosurveillance*'s in-house editorial team performs most editorial and all publishing tasks, without involvement of external parties such as typesetters. This allows for great flexibility, particularly in times of emerging or evolving public health emergencies [4-6], when case numbers or other relevant information/data can be updated even hours before publication.

2 or more genes. We agree!
What happens when its 2 genes and ...
1) is the non-specific E-gene that hits other viruses
2) is the insensitive RdRp gene that dimerizes and
3) is the N gene that authors admit doesn't work.
You don't have 2 targets. You have 3 broken ones.

His opinion on the CD retraction request-
"Utter Discrace..
Absolute disgrace"
Mentions he is one of the @Eurosurveillanc reviewers for the retraction request. That is shocking to hear in an interview where he admits to not looking very closely at the CD primers???

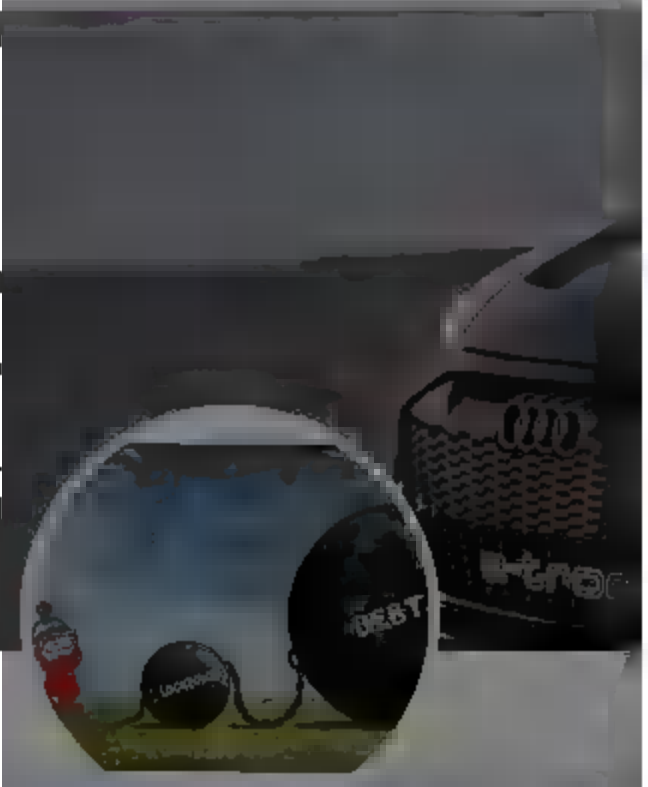
Simple yet v powerful. A reasonable conclusion is that around 40,000 more people than usual died at home. They're 'policy deaths'. Govt policy led to those deaths. An astonishing result. Hope lockdown zealots are comfortable with their choices. I couldn't sleep were they mine.



Ruminator Dan @RuminatorDan
Total excess deaths by place of occurrence, England & Wales, registered between 7 March 2020 & 22 January 2021.

Home 44493 (5127 Covid, 39366 non)...

Astonishing set of numbers. People will read into them many different things, based on their biases, but the 'non-covid home deaths' and -48012 non-covid drop in hospital deaths are telling some powerful stories.

I think we've massively misclassified deaths as Covid. But perhaps people dying in excess at home not due to Covid is explained because they didn't go to hospital. May explain non Covid hospital death decrease

antibodies. However, if this were to be the case this would then also prevent the formation of a placenta which would result in vaccinated women essentially becoming infertile. To my knowledge, Pfizer/BioNTech has yet to release any samples of written materials provided to patients, so it is unclear what, if any, information regarding (potential) fertility-specific risks caused by antibodies is included.

Francois, sequence homology is not long but it is there. For example VVNQN vs VVLQN in CoV-2 vs Syncytin-1. There are others. While not striking, 'what if' a polyclonal response includes cross-reacting antibodies? And motifs this small can give rise to cross-reacting antibodies.

Of course not the only grounds. You can read them in the summary.
A series of concerns, coupled with speed, added to which an unusual response from the authorities (who appear keen to vaccinate well beyond the vulnerable pop) add up to cause me anxiety.
Have you none, yourself?
